 the greatest andmirals of his age, was lurn at (humetha in IIGS. At in carly age, the took sorvice in the Enaril of the per", Imocent Vhll., and afterwards distinguished limself in the hattles wheh tho Nilancse and the French fonght against femat and the kings of Aragon. It was 1). whon, in 150:', after a slant camaign, erushed the robullion in 'orsica. When lichoa, in $151:$, get rid of the Firment (lomination, D. was appointed captain-gnoral uf the galleys, in which capacity he carried on a war of extermination against the dangerons swarms of African pirates who infested the Mediturraman. buring the war loctween Francis I., kinis of Franer, and Charles Y., conperor of Germany, and kine of Xpain, D. commandel the French tleet, reinforecol by his own galleys, and inflicted everywhere semo lusses ujon the (nemy. After the defeat of Francis 1. near J'aviiv, 1), accepted the command of the papal fleet; lat unu the roturn of the king from lis eaptivity, enteres once more the French sorvice, with the tithe of High Admiral of the Levant. He hockaded Genot, for having 'spousen the sause of the emperor, and putting to thicht the party of the Adorni, took the town. On finding the imdebendence of his comutry threatened by the liouch, 1). with his whole force went over to the empurar, and by so doing hastened the deliverance of Italy from l'renel domination. In 1529, D. entered (ienoa without resistance, and refusing the titlo of sovereign, whieh was offered hy the emperor, estathisheel there a popular form of government, which remamed in vigur up to the end of the repullic. The grate. ful comentry lecreal him the title of 'Vather of Peace;' and the emperor, in whose service 1). contimed, conferred upou bim the order of the Golien rleece, tomether with the principality of $M$ anti. In 1532, D. won a decisive victory over the Turks near Patras, and the conquest of "Tunis (1.53) way chicfly his work. He took part in the joint expedition aqainst the Turks under Larlarussa in 1539, and in another agamst Alviers in linh, where he lest eleven of his own galleys. The tranuillity of his last years was disturbed by the conspiracy of Fieschi. D. took ferce revenge ulon the eonsiniators for the death of his nuphew (rianettim. I). died without offspring. in 1560 , at Genoa, in his ! 131 year.

DO'RIANS, on of the four prineipat penples of Greece. who took their nane, according to the legend, from Jorus, the son of Jlellen, who settled in boris ; lout lierolotus says that in the time of King Deucalion they inhabited the distriet Phthiotis; and in the time of Durus, the son of follen, the cumbtry callem JIistimotis, at the foot of "Issa and Olympus. Bat the statement of Apmollomis is mure probalde, aceording to which the would appear to have ocoupied the whole muntry along the northern shore of the Corinthian (inli. Indeen, Ioris Proper was far too small and insiguificant is district to furuish a sufficient number of men for a victorions invasion of the J'elonnuncsus. In this remarkathe achiovement they wore coojoineal with the Ileraphatie, and rulai in Sparta. Durie cenlonies were then fommed in Italy, Sicily, and Asia Minom. Strikingly as all the four nations of Greece differen from ewh other in language, manners, and form of government, the U. in particular differed from tho

Wo'RALNT (Fr. sleming. In heraldie represomathon, an animal dmmant has its lemul restmg on its fomparst, whereas an animal couchant has its heral mert.

DOH:DINT VITARITV is a term used to a. inglato a peculiar combition which is mamifested ley many ortaniscel buings aml which is charactorimel loy an :uparent suspumsion of all the vital actions. Ib ings in thas state can scarcely le said to
be ulier, since they exlinit no vital activity, nor can they lee desimated as dred, since that implies their incapalility of resuning their former state; hence, since they rotain their prealiar attributes without manifesting them, the term durmant vitality seems the most apropmate for them. This comdition may result cither from the withrawal of the stimuli necessary for the mantonance of vital actions (as water, heat, \&c.), "i it may proced from some change in the organism itstlf, wherely its power of resomding to these stimuli is for a tine dimin. ished ar lost. Tre shall illustrate our meaning by a few striking examples of each kiud of dormant vitality.

1. bormant vitality from the withorawal of the necessary stimuli.

Seds deprived of access to air and moisture may retain their vitality for an enomons time. 'I have now liefore me,' says Dr Lindley, 'three plants of raspberries which have leen rased in the gardens of the Horticultural Society, from seeds taken from the stonach of a man whose skeleton was fomm thirty fent liclow the surface of the earth, at the lottom of a harrow that was nened near Dorchester. He hat been hurich with some coins of the Enperor Hadrian, and it is probable, therefore, that the sects were I6\% or $170 \%$ years ull.' A more remarkable illustration of the vitality of seets is affor led ly a case commonicated to Di C'apronter, and lublished in his Gineral and Compantime Physiolom, the facts of which may he shontly stated as follows: In a town in the state of Mane, alont 40 miles from the sea, a well was being ding, and at a depth of abont sil feet a stratum of sand was found, which exciten interest, from the circumstance that no similar saud was known to exist nearer than the sea-beach. It was, in the first instance, collected in a heal, but was sulsequantly scattered about the spot on which the heap had stood. In a year or two, when the very existence of the sand was almost furgotten, it was obsurvel that a large number of small trees were growing up on the sromed where it had been strewed. They turned out to be beach phum-trees, and they actually bore the beach-phm, which had never lefore been seen except immediately upon the sea-shore. These trees had therefore sprung up from sects whieh were in the stratum of sea-sand that had been jiereed lyy the well-diggers, and had probably retained their vitality through a period of time luyonl the estimation of human calculation -the period, namely, in which the sea had gradually receded forty miles from its present limits.

Among the lower anmals, we timl several of comparatively complex structure, in which dormant vitality can le induced for a considerable promb as, fur instance, several yars by the abstraction of their mosture. The well-known rutifer, the wheelmimaleule, may be realuced to a state of perfect drymess, and kept in this comdition for at great length of time fertainly three or finu years, and smbe writers say far longer) withont evineing a sign of life, and yot it will immoliately revive on being monistand. "The Tareligraden, an allied tribe, have Inen desiceated by the most powerful means which Chemistry affords, and have huen then heated to a tomperture of ant and have still berm revived by watar. althoush in their actiwe state a temperature of 120 'destroys them. In Wimolward's Mienual of the Hollesect, taves are momed of living smails erawling out of shells which were supposed to be empty, and in which thry must have heen tormant for several yars, and the eqges of suails and others of the lewer animals have is still meater power of revivilication after drying Sir Aames Emerson Temont leseribes varions fishes in ('eylon which bury themselves in the mul when the pools or
1019
tanks diry up, and remain topplat until the prombia rains of that comatry ansme and previont anservers hail noted similar facts in other trapabal comatrics.
 times famed alise, thengh tompid, in hardemal mud, and revive on the apllication of wather.

A dimmution of tomproture will inlum this phenomom in many animats. In con of Captain Sir dames lions's vingres, sumal catropillus hamer
 frowe su completely, that whan thenwn in atmader they chinked like hamer of in. Whan thatend, they Frimed their movernonts, tomk fora, and harima transmoned into the chrysalis state. Ghe of them,
 serpuntly hemene a moth. In the Aorth Amoriom lakes, frozen lishes areoften forme in the ice, whels revive when wently thanwe Spathozani kept fooms and smakes in a tompin state for then yours in an ice-house, and then rewed them ly wanth. 'Phe same capability loms mot exist, at all exats to the same extent, in the warm-Whmed animals. I thent suspension of vital activity in a hiril or a mammal for any length of tims. from the probured application of sewere ehn, or fram any wher conse, is morm followed by reenvery, The stomice of eertain hided burying themselves in the mul durine winter, are regivind ly the lust authorities as mume than one s.
 ximos), the suspension is not total. How we :re to explain, or whether we ought to helieve, the rematsalile cases of certain Iadian fakir, when are stated to lave the fuwer of suspumbing all themo vital activity for day's or even werks, we hame hnow: The late Mr Bram of Manchester pmbishend a collection of these eases, directly olitameal from Britishoffees who had been eye-witnesses of them in Judia, in his obserrations on Trome or Memen
 for ly Nir Claute Wade. The fatio was louried ill an undergromel cell, under strict gnationship, for si, mokes; the lomly hat heen twie dut up ly lion. jeet hingh (at whome eourt the exhilation eame oil) fluring the perion of interment, sun? hall lean fomme in the same position as when tirst horicel. In this and in all the other reconden eases, the apmerance of the holly whon tirst disinterred is despribed as guito corpsedike, and wo pulsation romld le detected at the leart or in the arteries. The means of restoration emploged were chidly wamth $t$, the vertex, and friction to the haty and limhs.
$\therefore$ Unmant vitality from changes within tha or manisu.
'The insect wohd aftomen us the chief ilhustrations of this variety of domant vitality: The Infor on chrysalis stare of insect life is in itself one of dormant vitality, monnected with any of the extermal inthonees which we have heon describine. That this stare may le much shortencel ly artibicial heat, and prolonged ley artificial cold, has heen known since the time of licmmur: lut, as the following cose shews, there are other cances inherent in the inmal ibself, which temd at a certan time to probug the papa condition. In the Pendio Methmon there are two generations evory year; for the luttertly that coms forth in the carly smmer lays egres which mapilly pass through all the phases of inseet hife, and probluce another set of ecgstater in the season, whase lerve or caterpillars tien into mone before the winter. The pula stace of the hirst boond (in July) lasts mly thinteen days, while that of the secomi brood (which commences in sentember) lasts nine or ten months, the lintturdy not appearing matil the following Junc. The diference of temperature is obvionsly puite insuthicint to acount for the great diversity between the two periols. Several othor 14

Mountains ${ }_{4}$ is situated in lat. $46^{\circ} 35^{\prime}-47^{\circ} 31^{\prime}$ N., and long. $5^{\circ} 42^{\prime}-7^{\circ} 4^{\prime}$ E. Area abont 2000 square miles. Pop. 286,858 . D. is traversed by the river Donbs, a tributary of the Saone, and is separated, on the north-west, from the deprartment of Hante Sione by the Oignon, also a tributary of the Saone. The surface is hilly, being crossed by foum parallel mages of the Jura Nountains. The climate is more rigorous than that of most districts in a simiar latitude. Among the eastern vallers, where crops chiefly of oats are grown, the harest opmations are wften stopped ly snow-falls, which hio until April or May. Abont one-third of the surfue is aralle; hat the seater part is corered with forests. The pime and the walnot attain a huge size, and the common orehard trees thrive well. Maize, [utatoes, homp, and Hax are raised. The pasturage is excellent. and rears goon loreeds of horned cattle and horses, which are exported. In the valle.ys, reat quantities of loutter and cheese are porluect. The rivers are well stored with fish. Mines of inen amel cond are worked, and Sypum and marlbe ate almmont. The tralu' is principally in iron, cattle, horses, and rairy produce. I ), is clivilem into the four arromlissements of Fesancom, Bamerles-Dames, Montbelliard, and Pontarlier. The capital of 5 ). is Feesangon.

DOLCHE. See Batir and llympopathy.
DOUGII is the name given to the moistened aml leneaded flom in the first stare of nombing Srear (q. v.).

DOU'GLAS, the larsest town and prineipal seaport of the J le of Man, is so called from its heing situated near the junction of two streams-the Dhoo (hizets) and Giluss (eray). I). Lies on the margin of a hirhly pieturesput hay, on the east side if the islami. Ferm the excerlenee of the sea-bathiner, anl its centerl position, it is fast increasime in inportance iss a waterinerplace.

The nd town, standing on the south-western alse of the bay, consists of narrow tortuons streets, and presents a rivid contrast to the handsmoe momern terraces and villas whele oecups the risine gromed beyonk. Comspienous in the rentre of the wescent of the biay stands Cistle Monm, fimmerly the residence of Jomm, Foke of Athol, fint now converted into a first-class hotel. The "lower of licfuare, is pieturesque object, ocenpies a lanerrons rock, in the sonthern area of the bay, calleal Conister, and was erected in 1833 for the safety of shipwrecked mariners, ly the late Sir William Ilillary, Bart, who, during his residence at J ., forntad the lioyal National Liferont Institution. D. is the pine ion packet station of the ishand, amd possesses tele. maphic comnomication with lengland. Pop. (1861) [2,389.

advanced in his Calcolonio, that the Douglases sprans from a Fleming of the name of Theobald, who, hetween the years 1147 and 1164 , had a grant of lands on the Donglas Water from the Abbut of Kelso. There is no trace of any connection between the Flemish Theobald and the Dondases; nor were the lands which he acquired on nome shle of the stream any part of then ole] domain on the othor. What was hoasted of the bouthases hy their historian, two centuries aro, theretore still holds true. - We do not know them in the fonutain, but in the strean; not in the root. lnat in the stem; for we know not who was the lirst mean man that did by bis virtue raise himself aloove the valgar.' It was thonght likely, in the beginnine of the l5th century, that the Donglases and the Murmys had come of tho saus stock, and in this old conjecture all that is linnwn on the subject must still be smmed up.

1. IVillicm of Doullus, the first of the family who appears in record, was so called, dombtless, from the wiht jostoral dale which he possessed. He is fonnd witnessing charters by the kiner and the Bishun of tangow hetween 1175 and $1: 213$. He was either the brother or the larother-in-law of Sir Ereskin of Aluray, and had six sons, of whom Arehimal, or Erktubld, was his heir ; and Jifice, a monk of Kiclso, rose to le Prion of Lesmaliago (a cippemency if Kelsn, on the outslirts of Douglas(dale), and in 120:' was prefermed to the great hishoprie uf Marmy. He owtal this promotion, bo donbt, to the inthence of his linsmen the Jlurays, and it eoutributed not a little to the rising fortunes of his own honse. He was followel beyonl the spey by four brothers, of whom one lincane sherifí af Elrin: another became a canon of Nurray; a thind, who hat been a monk of liedso, seems to hare lecome Archdeacon of Muray; amd a fumth, Who had heun parson of Donglas, allyars to have Decome Dean of Murmas:
2. Sir Archithle, or Erkmbeth, of Dougles is a witness to charters hetween 1190 and 120.3. Ho attanued the rank of knighthool, and beside his inheritance of Dourglas, held the lands of Hailes, on the Water of Leith, from the monks of Dunfermline, an 1 hade a grant of the lands of Levingston and llirdmanston from the Earl of Fife. Ife is said to have acquired other lands in Clycustale by lis mariage with one of the two diaghters and horresses of Sir Juhn of Crawford.
B. Sir Wrilliom of louplas, apparently the son of Sir Arehibald, tignes in recort from 1040 to $127 \%$. Jle appars in 1055 as one of the Scottish partisans uf kinf Henry Ill. of linerland; and in $126^{7}$ is found in pussession of the manur of Fawrion, in Northmmherland. hy eift of the kine'g son (afterwards Edwad 1.). We seems to have liad a lather, Nir Andrew, the progenitor of the Ihmolases of Dallicith and Morton, and certainly lial two soms.
3. /auk of Dumolus, the elder, acquired lamb it Glencorse, in Lothim, by marriage with the sister of Sir llush of Abornethy ; aml dyine wilhout issme abunt las7, was smeroded hy his yommer brother.
4. Sir lliliam of fonugles, distingushed in the family trubtions as Hellimm the Hordy, had all tho darinir and restless girit which was chameteristic of his desermbants. His first abluarance is in $1 \div 67$, when his lwal was nearly sevored from his shouders
 of the men of liendestale. Fwenty years later, he is fomme at the $\mathrm{l}_{1 \text { wat }}$ of an armed land, carrying oif has fature wife, it wealtly window, Alionora of 1, watme, from tha minor of har kinsfolks, the In Yomelos, it 'lyment, in lathian. Wrabuar of him immerliately afterwaris as sporling the monks of
 of a julnment in forour of his mother, malawfilly
imprisoning thece men in his castlo of bomglas, and beheading one of them. He was the first man of mark who joincal Wiallace in the rising against the longlish in 1 en? ; and fon this him lands of Domghas were wasted with lire and sword, and his wife and chidren carriod wid. by lidnet biner, the

 lombers, and submitting to his wh pitron, Kinf
 Coalty, was sent pisoner to the enstlo at York, where le died alont 1 bow. It aphars that he puse sessed lands in one English, and in sipm sontish cometies-Northumberland, lacwilk, Edimhard, Fife, Lanark, Ayr, Dumfriss, and Whem.
5. The history of his som, the Geroul Nriar Jamesy of Douplos, is familiar to every omb: at lince's greatesi captitin in the lons War of the sumessim. The hero of seventy fiehts, $h_{\text {en }}$ is said to bave won them all lont thatern, leaving the name of the Black Toughas'-so be was called from his swartly rom-plexion-as a word of hat ly which English mothere stilled their children. The was slain in Antalusia, in 1330, on his way to the loly Land witle tin heart of his royal master, and dying momariol, was suereeded hy his hrother.
6. Huch of Donglus, of whom nothing is known except that he made over the now krat domams of his family, in $132^{2}$, to his nephew, sir Hillimm of Dougles (son of a younger brother of the Ginod Nir James-Sir Archibald of Dondas, Lierent of frotland, slain at Haliden Hill in J.5:3).
 no ligher title than that of knight; lut in 1050, sir Willian of Douglas, who had fought at lentiers, :nnt distinguished himself in other fiches, was made Farl of bonglas, and afterwards by marriase beane Larl of Mar. His ambition amed at still greater things, and in 1:37 he disputed the succession to the soottish crown with lienert II. (the first of the Stewarts). He clamed as a descentint of the Baliods and Commings ; and his pretensions were abandoned only, on condition that his son should marry the: ling's daughter. He died in Iast. His smames, second Gall of Bonglas and Mar, the conporm of Hotepur, foll at Otterhum in 1:3s: amp as he left no legitimate issue, the direct male line of Willian the Harly aud the Good Sir dames now cane to an end. It is aunt had matied for her second husland one of her brother's esquires, Janes of Sondiands, and through her Lord Torphichen is now the heir general and representative at common law of the House of Doughas.
The earldom of Dondas, weamwhile, was bestowed on an illegitimate son of the Gond sir JamesArehibald, Lond of falloway, sumamed the (irim. Jy his marriage with the liegess of buthwall, he adder that fair larony to the Bonglas domains: and having married his only dangher to the hoirapparent of the scotish crown, and his cldest som to the eldest daughter of the Seottish king, he died in I. 101 . His sm and successor, Archibahd, fourth Earl of Douglas, was, from his many misfortunes in battle, suraname 'The Tyneman,' i, e., the lospr. At llomildon, in 1402 , he was whmed in five phaces, lost an cye, and was taken prisoner bey llutspur. Next year, at Shrewsbury, he felled the Luglish linge to the earth, but was again wennded and taken prisoncr. liepaing to France, le was there made louke of Touraine, and fell at Verneml in 1424. He was succeeded hy his son Arelibath, who distinguished himself in the French wars, and dying in I439. was buried in the church of Dumas. where his tomb yomains, inseribed with his hinh titles of 'Duke of Touraine, Earl of Donglas and of Longueville, Lord of Galloway, Wigton, and Aman-
dale, Linutemant of the kime of 'Eots.' LI is som amb sumensar, Willim, a lay on sixtom, is said to have

## DOURO-DOVECOT.

DOU'RO (Span. DuETro, Port. Doūro), the name of one of the largest rivers of Spain and Portugal, rises in the province of Old Castile, albout 31 miles west-nortli-west of the town of Soria. From its sonure it flows sonth-east to Suria, then winds towards the west, and $I^{\text {murshes a }}$ a gencral westward direction till it reaches the Portuguese horder ; it then flows sonth-west, forming for abont 60 miles the lonulary between Span and Portutal; then crossing l'urtugat and flowing west, it falls into the Athantic hemo Opmotn. Its Portnguese tributaries are ermparatively small. The tntal lensth of the river is alsout 500 miles, The 1 . is a noble river, and flows through some of the most imposing rockscenery in the world, as at Parea didlya; hat is rapich, and of lifficult mavisation, on account of rocks, sand-hanks, ice. It passes through a large portion of the winc-country of Portucal, and consers the produce to (porto for exportation in flat-buttomed boats. containing from : 0 to 71 pipes each.

DOVE (probably from the same mot as dive, owing to its halit of duking the heal; comprove Lat. "olmuln with (cre lohzulam, to dive), a name sometimes extended, as the mame Pigeon also is, to the whole family of Colmulidis, sometimes like it restricted-at least when used withont frefix-to the femus Columine of the more recent ornithological systerns. No distinction between the terms dove anil ligeon is sanctimed either hy comstant scientific or grneral pophlar use. Aumbon attempts to make in "istinction, wiving the name pigeon to those species of which many nests are built cluse torgcther on the same trees, and dove to those which are solitary in the miditication; but this distimetion is quite unsmitable to the Eurpern spectes, and contrayy to Eritish usage. See Prgeon.
gove. In Christian art, the dove is employed as au cmhlem of the Holy Ghost, no doulit from the fact of this heing the furm in which the spirit descemed on our Loril at his hapism. From the dure beine also nam to symbelise purity, it is generally represented white, with its heak and claws red, as they occur in nature. In the ulder $\boldsymbol{l}^{\text {nictures, a }}$

 In staincil glass windows we sue the dow with sown bas parmbins from it, tominating in sebon stars, wimiteative of the seven gifts of the Holys Spirit. churches, is sometimes made in the form of a dove, and suspended over the altar'; and the dove is often placerl on the covers of fonts. In this position it may still be seen in parish churches in England.

DO'VE, H. W., one of the most celebrated living mysicists of the continent, was lurn in 1803, at Liegnitz, in silesia, where his father was a merchant. He studiel at Breslan and at Berlin, at the latter of which ho took the degree ri Dactor in IS26. The was successively 'privathecent' and assistant professor of natural philosophy in könicsbers. Having been transferred to a similar post in Derlin, he subsequently luecane full professor, and was elected to a seat in the Lopyal Academy of Sciences. His writings, which are very numerous, are to be found in the Memoirs of that heademy, and in I'orgendorff's Aunalen, besinces several published seprately. The most culomated of these refer to Dleteorolory, Climatology, Inhead Electricity, and Citcularly Polarised Light. The may mention amone his works Ueber Maas oud Missun (2l edition, Berlin, 1835), a treatise on the at of measuring, and the origio and comparison of the metrical standards of different mations: Metcombogische Cntcrsuchungun (Berlin, 1Sa3), a remarkalle treatise: tebe die nicht periodischen Apultwourn iter Tomperturertheilung auf der OHmaintac for Erte ( 4 vols. Werlin, 1840-is47): Cntorsuchumen in Gdnitn 1 I Inductionselectricitict (Berlin, 1sti). In conjunctim with other distinghished German hhotosphers, D. commenced, in Is:3, the publication of an catensive series of treatises on different braches of natural philosophy. This work, called Reqeitorium der Physit, remains untinsbel, lnat many of the treatises it contains, aml especially me of several by 1. himself, are aumirable. To him is due, amongst a great variety of optical discoveries, the application of the stereoscope to the detuction of forged hauk-notesan ingenions and useful illea. To English readers, D. is best knosn by lis treatise on the Distribution of Heut on the Surince of the Globe, which was pulblishet in IS... liy the British Association. In this work he enters fully into the canses of periodic variations of temperature at different parts of the clole, and lays clown in admirable charts the monthly and annual isothermal and isabnormal lines-thus tracing the variations in form and position of the different isothormals throughout the year. In arlition to the ahove, D., who is an exccedingly clear and able lecturer, has published several pirmlar velumes on different parts of his snloject, ammer which may be noticed the volume Zeker Electricilut (Lerlin, isis).
Thovicoot. It is cmactolly the Sootish statute [ 617, c. 19, that no person shall hind a devecot or pirem-homse cither in town on comery, unloss he hr pusessed of lants or trinils of the vearly value of tom chathers of victual, lying within at least two miles of it. It is also derdarel, that merson having surl 'Inalitication shall huid more than me dovecot within the 'lommes foresail.' It has been held that the statute impuses no rostraint on proprictors possessed of a creatm rent, beyom limiting them to now doweot for wh portion of sround that yields ten elhalders yomly. Ther statute does not extend to. dowents alrealy bult, and if a dowecot be challeneed, it mast lus jewed to bave been built sulusopumily to the dato of the statute, otherwise the contrary will he presumed. If an estate be prothased, in otherwise acguired from a person who was lually catitled to build a dovecot, the doseent may be lesally ratrined, but camot be relmalt if it lacome sumems. The statute 2 Coo. III. c. $2!1$, fir the protectimn of pigeons, wes mot extend to scotlime see l'itisons. Dovecot breakers are
guilty of theit, aml very severe punishmonts were assigned to them by the wh statutes.

 fonner The star $\%$ braconis is crlebrated ats thas unv nsel in deterninimes the co-efliciont of
aherration of the fixed stars. It is a bright star, nearly in the solstitial colure, and conserpently the minor axis of the small elbipse which its apparent place describes in the heavens, lies in the meridian at its transit. Moreover, at the two equinoxes, when its apparent place is at the extremities respectively of this minor axis, it can be olserved on the meridian at one equinox about sumrise, and at the other about sunset, so that luth whservations may be made without the interference of a too bright daylight. These two observations, therefore, are casily taken, and the difference in the north polar distance which they give, is the minor axis of the ellipse described by the apmarent place of the star.
DRACO'NTIUA, a genus of plants of the matnral order Artucut, of which one species, $D$. put!phyplum, a native of Guina, Suriman, and also of latia and Japan, has a pwerful action on the nervous system, and is useful in asthma: althouch at present its chief reputation is the somewhat doubtful one of curing the hite of a suake, to which its mottled stem gives it some resemblance. The flower, when it first exprands, emits an intolerable stench.
DRAFT, an order aldressed to a debtor by bis croditor, ealling mon him to pay a certain sum vince to the drawer or to a third party. See Bild, ('ineaty)

DRAFT, on DRAUGHT, a tentative eopy of a lecral dowment, or other formal writing, made for the purpose of aljusting the matter afterwards to be armitted into the fair cons, or engrossed, as it is callet. Manuscripts and 1 roof-sheets are the drafts of printed works.
DRAG, a mechauism for slackening the speed of carriages, hy ureating on one or more of the wheels. The form of drad best known to old travellers by "wach is that of the 'sloe.' a hollow piece of iron attached by a chain to the carriage, which being put below one of the bind wheels partially reduced the vehicle to the quality of a sledge; hy which drasging process the carriage was suitably retarded on going down-hill. Is the shoe-drag required to be alplied and romoved with sume inconvenient detention of the vehiche, a step was made in alvance when a metbod of retarding a wheel with. ont detention was discovered. This new process, which is known as the patent drag, consists of it eommectal picee of mechanism, altogether operated unn ly the driver without moving from his seat. I hanille affects a series of rods and levers ly which a succies of shoo is pressed against one of the wheels, so as to slacken its motion. Sueh is the kind of arag now very gemerally attachend to sentlemen's travellingeariagos, ommibuses, amd wher selinges for posseniers on the rods of Great linitain. It is of Frombrigin. Applime in either form. the use of the dram, indinemdently of its safety, is to allow horses to continue romines at ordinary spead down-hill, without beine maduly pressed on hy the carriase ham then. A simalar contrivance, hint of a mora puwernil kind, ealled a break or hreke, is applal to :urest the motion of railway-trains. Sne Rambats.
DhdeOMAN, from the Theish fukemen, the andral name given in Turlary to an interpeter, or to a phile to furpigners. Central America, being on the north-east coast of Veragua, the most mirth-westerly portion of New franala, and it communicates between the Caribbean Sea and Lake Chiriqui.

DRAGUO'N. From the old fable that the dragon sponts tire, the head of the monster was worked uren the muzzles of a peeculiar kind of short muskets which were first carried by the horsemen raised by Marshal Brissac in 16(1). This circumstance fot to their being called dragoons; and from the general adpotion of the same weapon, thongh without the enblem in rutstion, the term gradually extemed itself till it beame almost symomyons with horse-soldier. Dragoons were at one time a kind of mounted infantry. drilled to pertom the scrvices hoth of horse and foot. At present, dragou is simply one among many desirnations for catalry not very precise in its application. In the liritish army. the heney lragouns and the light dragoms are so nearly able in the weirht of the men, horses, and appuintments, that the meaning of the distinction is norly lost. The first dragouns in the amy were the ficots freys, establisheel in lis:';
In the British arnas there are at present seven regiments of 'Dracom dinark', aml 'Whteen regiments of "Dragome." see Hobse truhids.

DRACEIGNAN, a town of France, in the repartment of Var, on at tributary of the Argens, abonat 40 miles north-east of Toulon. It is charmingly situated, in the midst of a valley surromated by lills. the sloges of which are covered with cinevarifs and whe phatations. It is tolomhly luitt; amel its strects are alumed with numerous fomotains anel trees. Its principal structures are the prison, the court-hruse, a huspital, and a stately eloce-tower. It has manufactures of coarse woflens, leather, hosiery. silks. sap, handy, ol, and eathenware. Pop. 8507. I. is an ancient flare. Durime the midulle ages it was strondy fortifion. The fortfica. tions were destrovel in the cisil wars, but were recustmeted in 1615.

DRAIMAGE, in Husbandry, is the art of courying oft water from the soil aml sulstil of hum by meme of onen or chosed drains or trenchets-the term, however, is onerally understwon of elosed iruins. By its means, the fertinty of wet lanet has heon greatly increasenl. When the lrains are pat in wery six or tern yards, it is callen] furroun or frequent Mathing.

The vast amomb of eapital whele has been eguculed in drainase within a quarter if a renturg athests its utility aml necessity. liefore tho introduction of furrow drainines, stiff and tenacions clays wore of comparatively little value. They were rultivated at much "xpeniliture of labour, and the crops whieh grew mon then were intlumend to a frent exturn hy the variations of the seasons. A system by which wot and worthless land conld he remberal hry and walualde, was an inprovement sn patent to practical men, that we need not wondrat its remoral arlopition.

 limate ascricultmen writers mention the good results

 render the lome thy. Nome that a century age, at fore wepat. of why-land wats draineal at mame mherats in 天onfolk an! B s.ax, by puttine in hrosh.

 Fhaw abl patial, mall Ah smith of banstom (atume (1). midno (1) the 19the) remeed the prestice to
a system, and showed the principles npon which its effieiney depended. Through the exertions of this advocate, furrow-draining soon became a site qua non in the culture of clay-soils, or indeed any soil, in most elimates.

The great majority of practical men consider the line of greatest fall, or quickest deseent, as the hest for cutting drains in a field. This, it may be remarked, is also usually the direction for phoming the lam and forming the ridges; so that the drains are commonly put into the furrows, and hence the distinguishins appellation, furrow-draining. The smaller drains are usually conducted into larger or main drains, iustead of each discharging its quota of water into the open ditch. This is rendered necessary, as the mouths of the smaller drains would be more liable to be choked up by the growith of weeds; while the eollecting of water into main drains secures a fuller fow to sweep out any matters which micht accumulate where the discharge was small.

The most eficicut, and at the same time chaply ent drain. is one represented at fig. I. It is marke so that a pipe of a cylindrical form may be laid along the bottom, which shmbll be of ac: is necessayy to :lluw of the pipes being properly laik.

I'rains of this form are cat with a set of spades which are of different withes-the

Fis, 1. homer heins uscil for taking ont the top, and the narrowest for the bottom. The one which cuts the last spit is called the bottominy tool, and its intro. duction has effected a consillemble saving in entting drains.

Before the general use of pipes, stones were the common materials with which drains were fomed. Mr smith recommended that they should be broken so small, that they might pass through a ring two inches anel a half in diameter. From nive inches to a foos in deptli was the quantity which was commonly put in. This was foum to be a most efficient way of making trains ; but unless the slones combl be gathered from the fields, or quarried in the neighbourhool where they were nsed, an immense amonat of labour wals involved in filling them.

When tiles and pipes were irst uand, it was even thourht uecessary th have some gravel, or small stones. phaced above them in the crains, for the propuse of anabling the water tor find its way into them, as seen at fig. .2. It was soon fimad, howwror that tiledrains were quite as -theinnt without ay stones or
 rawi : and that they were less hable to lac choknd up, its thet way or earth acted as a filter in preventing the intrusion of any kind of solid matters.

Many kimes nif tites sud pipes have been tried, but the cylimirical form is now most used. At one time, a lone in the tib of an inch in hameter was thomethe wifient, hat two-inch tiles are now prefered. They are walle made ahout fiftem inches in lonoth. "The contimuty of the dran is mantaned comphemy by collems, which shomblay alwe bed as a monh for secmbing etheicocy and permanmey.

Thech whom hats taken phace in resind to the proper depth of drame, as well as the distance at wheh they hombl be placed. Mr Smith at inst alvenaten dhe making of drains from two and a half to thee ber dorp, and at interals of from ten to inty fert, ammbing to the nature of the land. Bxprimen, lawerer, has bew gromally favontige deeprol drain", at wiler intervals. Ar fiakes wont

## DIARNAGEDRAKE.

the length of recommentiun is depth of from four to six feet, at intervals of irma it to bif fect. If the deep dranage of land whoh this distinguisumed enginecr has advocated comot be successfinly carrich ont in all casses, the graphie mamer in whieh he has described his own experience, amb illustrated the principles of draning, leas loeen podactive of gond results. Lew on the most Concions snils with sulsoils of till, few now think of having drains less than three fort in deptli, though the distance apart should not in many cases be more than from 15 to 18 fect.

The mere tenacity of alays is not the elmont which determines the depth of drains, or the distanes at which they should be placed apart. It is now woll understood that the success of draining ly pipes depents upon the fissures which are prochuend in the sulisoil by the droughts of summer never entirely elosing upr ; and thas minute channels are formed, which lead the water into the drains. The coarse tenacious clays which are to be found in the chalkvalleys of England, cruck readily by the droughts, and form deep fissures, which reuder them comparatively easily dramed. On the other hand, in the moist climate of Seotland, the subsoils which are of till are long in cracking; and the drains in such land should not be so deep, and at shorter distances apart. As the properties of clays become better moderstood and elassified, practical men will som come to be more at one in regard to this important point connected with the economy of drainage.

The principal advantages of Iranage are, tha deepening of the staple soil, and renderine it mare friable, so that a superfluity of water, which would canse the formation of those chemical commomis that are found in stagmant water, is preventerl. The greater depth of mould, and more pericet culture. render the soil more absorment of meristure in dry weather. As crops can usually be sown somer on draned lands, they also ripen carlice, amd pooduce more aboudantly. In short. while drained land ubtains a greater eapacity for moisturn and manure, it imparts to plants greater eapaidities for economically working up the materials which they find hoth in the soil and atmosphere, soeing they are maintainel in the most healthy combitions of growth.

Damare in its various forms has, as is well known, not only improvel the fertility and value of land in Scotland, lout materially changed the aspect and climate of the comutry. Mosses and wet rushy lands have lowen transformed into dry and productive fields, whide by the manoal of all super. Hoous pools, the air is fred from those hovering sapows which are injurions to general amenity anil salubrity: To the farmer, the hore immediate advantage of drainage consists in that rapiol rumning off of the water which falls as rain, so as to admit of working lands without any mudue delay. This miversal system of draining has had a rentarkable effect on rivers. which, no longer ied by slow percolation from aljoining lands, are suddely swollen after rain, and as suddenly diminished in volume. See Rivets.
DRAKE, Sir Fravis, was lorn about the year 1539, in a cottage on the hanks of the 'fary; in Devonshire. His iather was a yeoman, ant han a family of twelve sons. Ite was a zealous l'rotestant, and during the persecution under Queen. Nary. he Hed from Devonshire into Kent, in which county his family was brought up. He obtained some kinil of clerical appointment amone the seafingt-men of the district, and in consequence, D's younger years were passed among sailors. Ite was at an carly age apprenticed to a neighbow of his father"s, wher possessed a bark, and wecasionally mate voyges tu

Whate the drama, dombluw, arase from that
natural lowe of imitation peculiar to man, and from the ehindike heliness with which a simple narrator loses to reconnt anythines which he has heare or secon, yet the creation of dramatic compesition was, nevertheless, a feat of singular bohluess. This arises from the wide difference there is between the disjointed elements of occasional imitation and the perfect imention of the gemine drama. 'The Ohd Testancont, mo doult, contains muncrons instances of Mramativ dialugue, as in the Book of Job; and of lyric jenens placer in a dranatic connection, as Summon's Sung; hat thre is mo instance in Lielrew literature of the existence of the drama properly su called, The Hindus have an early dramatic putry, but, nofontmately, this poetry maly hates hack to a time when the intercourse betwen divece and ludia was close and frequent. It is to firece alone that we, aceordingly must lonk for the invention of the drama, and to Athens, 11 purticular, fin its perfection. Hit even here It was uriginally exhiliter only at a few festivals of a single coit, Dionysis. There can, then, be no domit that the mirin of the dramil is to be sument for in the cuthnsiasm attendant on the wnship of thachns. The ancient Greek writers toll 1ns, that the ilrama misiated in a choral sons: amb Aristntle (Pol. 4), that it had its origin in the simers of the dithyramb. Shmosing that it orginated in the pantonimic clances, the dramatic art, like every other, was only slowly puritied from extranemis mixtures. Even the origin of the word tragedy has bem disputed, althongh the inventor of it, Arim (5so h.e.), the celebrated dithyrambie prot, is hown. Trusely (fremedia, from trapos, it wnit, and oin, a somy is sad to have taken its wise from the fact of the old dramas leing cahilited whell a gonet wats sacrificed, or hecanse it goat was the prize, or hecanse the actors were clothed in natrkins. Put in Spain this is by no means the case, for their luest poots, while writing for the stage, have busied their 1 ens in the composition of religions dramas. Passins aver the names of Villena, Santillana, Nahatro, and Incda. as diligent but comparatively weali huillers of the fame of the Spanish drama, we come to the periods of C'rivantes, ot Lopez de Vega, and of Calleron, when the Spanish stage may be rexarded as in its best comlition. In his Vumumin fraticularly, Cervantes, whose genins was more decicledly epic than dramatic, has left to the world a specimen of tragic inventim and of moral disnity which it is mot likely to forget. While the crities were clasouring about the classic rules and the Aristotelic muities, Lopez de Vega appeared on the scene, to set nearly all the dramatic laws at detiance. He is the most fertile dramatic writer in the world. besides being one of the best. Yet lie mostituted his pen to serve the public, and sacrificed lis future fame to his living popularity. Calleron, who sueceeded him, possessed all his adrantages, with the important adulitional merit of luise thoroucrhly devoled to dramatic art as to a mistress. So great was l'alderon reckoned in the camposition of relininus plays, that by letterspatent he enjoged a monnmby of these produc. tinns for 37 years. The briliant period of the Spmish theatre, comprisins the irst half of the 17the, loud with the death of Calderon well-nigh clesen. Jixept Moreto, Tirso de Nolina, ane Solis the listorim, there is no writor of any note to chare the attention.

We come now to France, where the unities, as they are called, have been observed with as much strictness $a$ i if the country had been an old frecian provinee. 'inis is chitlly owing to the intluence of the criticisms of Boileau, who adopted the clramatic mantins in all their severe riwon". 'The crities of other nations. particularly of Gerniany and of England, Hare chusen to contemn this exposition of the trama, anm sometimes to despise eren the Stagivite as a dramatic eritic. The dramatic unitics are threefoldAction, Tines, and Place. Aceording to the French, these mities have the following simmicance: 1. That the action of the dramm must lu wne-that is, that the interost or attention must not be distracted ly Stromal plots, but everything must be subservient to the main action; 2. That all the actions must tukic jlace on the same spot, or very nearly so, in order that the ilhusion may not lee disturbed; ami B. Eferything should happen on the same day for the sane reason. Duch has heen written fir anm ugainst these rules. Sitfice it to say that these are the landmarks on which the dassic chamatist fixes his eye. l'revions to Joteple, or jubeted $t$, Corneille, hiandy any progress had been mame in the regular dama in france A mumber ui writers, if more or less ablity, lad probluced musiors, soties, morulites, forces, in which, in monernus instances, the ramantic or anti-classical tometemons of lmman mature hal manitested themrelior: lint mithor in the cass of the lirethmen of

produced seven mays, as cold and as severe as if they hal been mritten by Sophocles, but of sreat elegance and dignity of style, when it struck linn that he might give wore free scope to his remantic tendencies in the tragedy of the ("id. All Paris rang with its praises, but the acad my gloomed, and joor Corneille had to hetake himself again to the dignity and severity of the Greek drama. He got what he longed for, however-a seat anoong the members of that institution which had leen so instrumental in repressing the spontaneous outlow of his genins. It was more than his successor, Melliere, obtained, who insistel to the last on playing lis part as well as peming his , rieces-an abuse which the diguifich acadcmieians could by ne means tolerate. The genius of this dramatist was decidedly comic, and it may perhaps be questionel, whether, in all the essentials of true cemedy, Moliere's is not the very foremost name in the history of the stage. He borrewed much from the Spauiarls, though perhans less than Corneille; a great deal from the Latins; and more perhaps from the Italians. But the favourite tragic poet of the count of Louis XIV. was Racine. 11 is genius lay decidedly towards the serions and the exaltel, so that he had no teniptations, like Corncille, to trespass the bounds of the aeademic proprieties. In tenderness and elegance, all Fronch writers give way luefore him. In his Athalie, his last and best drima, he gave to the Parisian pullic a composition, sucl as in brealth, in elegance, and in severe grandeur, it could nowhere find out of the Greek theatre. But we must push throngh the erowd of lesser lights which shone on the decline of haciue and Moliere, and glance at that bright and fitful luminary-Voltaire. He pressel bellly forward, and astonished all Europe with the force and power of his romautic dramass, a style of composition which, since the Cid of Conneille, had been altogether excluded from the theatre. His spirit of intolerance was perhaps felt in his dramas. and his increasing warfare with superstition and fanaticism was too distinetly experienced eren in the theatre. lint his genius and spinit have earned for him a place beside Corneille and Racine as one of the tragic names whom France delights to remember. Boussault, Regnard, Legrand, Lemercier; Victor Hugo, Dumas, and Alfred de Vigny, would all require to be noticed in a full view of the French drana.
The ferman drama is almost whelly dependent fur its fame on the names of Lessing, Goethe, and Schilier. For while liosenpluet, Hans Suehs, and Ayror were criginal, and some of them fertile; while Cirybhins, Gottschen, Gellert, and Sellegel show a hedided advance in the appreciation of the laws of dramatic composition ; yet from the feelleness of the writers, and from the backward state of theatrieal tate in the ennl of the 17 th and the leginning if the 1sth emturies, wery little was done towards a clear :and distinct recugintion of the excellence of Mranatic literature, till the critic Lessing, in his Miss Sorra Somplan, tautht Cermany to appreciate the promuctums of the romantic drana. As a critic, he hame the Promeh, praised Nhak quare, and professed hinlini in Aristatle. Wr held mome than one dramat io horesy, :um his antipatly to versilication was :mone the number. (ixedir is, without dould, one of the greatest prminess which the world has sisen, lint whether he is entiden to so high a place fur his theitrimal drumas remains an open question. As his aim was lume enghatically the culture of his annins in its fillest form, the circumstance of his writinst assuming the dramatic form is rather
 setme to biave beren distinctly aware of this, and in
the prologue to his last, and hy far his erambest production, he elcelares why la comld not aceommodate his gemins to the demamels of a mixul theatre. See his finust must whe be regaritel as one of the gandest and most romathabl: compoisitions which monlern Lurope has wathessend. Schilles was mure expressly the hamatic pret of Gamany thim (inethes. While divethe's gemus was filler and mon" eomplete, Selsiller made u! for what he wanted in breadth of vision ley the munal int nasity of has genins. From his wild play of the Rohlerese down to his last dramia of Willelm Till, he worked with a

Jramatic exhibitions in lingland, if they did mot origimate in the church, wre newertheless sperily :lnmoriated by the elacy. Leclusiastics were frequently the composers of the religons pieces, or mysteries, and they were fomm not seldom to be the actors. The mass of the petple, no doubt, owed a gool deal of erotesque amusement, and even of occasional information, to the biblical and legendary listory, which those rule attempis at the drama were jitted to convey. Those old rulyions plays are gemerally divided into two clacses-miructes or niracle-phays, and moratitios in morals. The fomer were fombled on Seripthat narvatives, or on the legends of the saints; the latter arose from the fomer, by the increased introduction of imaginary features. These $p^{\text {inn }}$ pastimes existed long before the lieformation, and were not overthrown ly that arat revolution in the opinions and beliufs of the comery. Se Miracle-plays aml Momblitis. It was annot the midule of the leth $c$, that the Irama extricatod itself completuly from these ancient fetters. I:y this time both comedy and tragedy had hegron to exist in a rude reality in Endand. The oldest linown comedy (before 155), that of Ralphe Roistar Doister, was writton by Nichmas Culall, a schomlmaster of considerable learning, probably aluat the midule of the loth century. Ton years after apmeard om first tragedy, homon whinsly as Gorbutue, or as Fervec and Porrer, lig has Norton and Lard Buckhurst. Amb but only is this work the earliest tragedy in our languag ; it contains, beside, the first application of flank verse to dramatic composition. Fut the phay is dull, hary, ant dedamatory. The dmana hasered in this incipient eourlition until very now the time of

DHAWMBACK, atern in commerec, emporal in comection with the remtting or payng bate of exeise duties on vertain classes of articles exportent. Exejse duties, as a matter of comse, enhance loy so mants the natural price of the commodity on which they ire immsel. Were these duties mot remitted, the" commoslity so taxed would not lie redered tom thase fordign countries where articles of the stme kind could be purchased free of such haturs. 'Po aflond facility for the exportation of these artione, the state resorts to the experinat of returnins to the exporter a sum equal in amoment to what how ir the mimufacturer had paid to the exces. Sum is drawhack. Amone uther matters of tiseal lwhey, Adam smith, in his Wealh of Natime, disensse's the propricty of giving drawhacks, and socs in them nothing that is :uberse to a somml phatical economy. 'To allow,' he says, 'the merhant tos draw back upon exportation, either the whoke or ar part of whatever excise or inland haty is impusind upon domestic immstry, can muer ocoasion the expertation of a creater quantity of eromes than What womld have been exported hat norluty lacin imposed. Suh enonravements an not temed tu turn towarels any fartioular emphoment a ereator sinere of the eapatal of the country than what would aro to that employment of its own acemal, lunt only to hinder the dhty from drivine away any pirt of that share to other emplownents. They to not nut to overturn that halance whim matmally estalsishes itself amony all the varions emphements of the socicty, lat to lionder it heing owerturned by the duty : they teml not to destroy, lat to preserve, whit it is in most cases amanazemens to preserve, the natural division amd distrantion of lahome in the socjecty: Correct as is this view in gomeral principle, it could pertaps be shewn ley the eloser expernence of the present day, that the practice of giving drawhacles is lable to ahonse ; as, fer example, when an excisable article falls greatly in value, amb it is exported in order to get the drawhack. with little or no reference to sales abmant, or in the hope that the drawlack will at least hoine the amount of the fremht. So far, therefore the state is male to foster an improper spectics of commerce. To prevent deceptinns as har as is practicalle cortain rules and fomalitits have to he attembed to b exporters, to which we shall brietly refer.
 packed in presince of an excise otheer, whas sees them weighed, if the drawhack depents on weight. When the packase is completed, he encloses it with a tape, which is properly tixed with a seal. Cumer
this seal it is transformed to the funt of higment,

 its "peration the drawhach ja givily the antum ramme ilabirtand.

(1861) 5242, chietty agricutural. There are manufactures of paper. ind of hair-seats for chairs. The parish church was built in stephen's reim, lint quite altered by repairs in 15\%. Here, in 1459, the Yorkists defeated the Lancastrians.
DREAMING. 1n complete sleep, there is probally an entire absence of conscionsuess of extermal things. Esually. however, there is a certain amomet of mental activity, of which we are more or less conscious at the time, and of which we have more or less subserpent remembrance. This is the state kuwn as dreaming. The chief feature of this state is 'an entire whatho of eolantury control orer the cinvent of thought, so that the principle of sumpers-tion-wne thonght calling ur anther, acenring to, the laws of assmiation-lhas mamited onration,' We seem to perform ali the actions of life; we expermence every lime of montal emotion, and somethmes owr reatoming proceses are markally dear amb complete. Thus, when the mind, darine sleep, thates min train of thought on whel it hand been forvimsly eneased daring the procolins waking lomers, intellectinal efforts may be ande during slece which would be impossible in the waking state. such cases, however, are not common. Tuname two in tances (quoted ly Dr Curpenter in his essay on
 (burbect saw, in his dreams, the thal steps if a dificult calcmation which had pazzenl him during tho day : and Commillar states that. when mpsem?
 timshell a subject in his dreams whicti he had brokem all hefure retimestore rest.
Weasionally, but by mand commonly, dreans sinm to pensess a remarkable coherence amb conpraty in wherne to the reasming fuecoses, on the comblantions of the imagination. Abst of rur rembers are probably arfuanted with the incident manatel hy coblerishe of himself, that his frament. "buthed kimble Khm, was compuser? durines sleep,
 ins the followne womls in lumelas's Piturims: "Hores the Klaw Kinhat commamber atace to be hant, ambatatily gardon theremato: ame thas ten mane of forthe gromil wror moloseni within a wall.' Cindrifon contianod for abut the fons apparently in a promand slom, dmane which ha hat the mast wai impression that hather compesed hetwem 200 : and : ham as thane, with it fasaldel jroduction of the
correspondent expressions, without any sensations or consciousness of effurt.' On awakening, he had so distinct a remembrance of the whole, that he seized his pen and wrote clown the hines that are still preserved. Unfortumately, he was called away to attend to some lusiness which lasted more than an hour, and on his retarn to his stady, he found, to his intense mortification, that 'though be still retained some vague and dim recollection of the general purport of the vision, yct, with the exception of some eight or ten scattered lines and images, all the rest had passed away like the images on the surface of a stream into which a stone had been east.' In other cases, a diream may leave a strong general imoression on the mind, although larticulars, even immediately on waking, cannot be recallect. Tartini is said to have composed the Deril's Sonata under the inspiration of a dream, in which the archtiend challenged him to a trial of skill. The dreamer lay entranced by the transcendent performance of his distinguished visitor: but on awakening and seizing his violin, although he was unable to reproduce the actual succession of notes, he produced from his general impressions the etlebrated composition which we have named.

Generally, however, dreams are wanting in coherence; all probabilities, and even possibilities of 'time, place, and circumstance 'are violated. Friends long since dead appear and converse with us; amb events loug since past rise up before us with all the vividness of real existence. We may be conveyer to the antipodes, or even to world lreyond our own, without the difficulty of the distance at all standing in the way. We are not aware of the grossest incougruities, frobably hecause we are mable to test the probability of the phenomena by our orrinary experience: beuce nothing that we see or do in a dream surprises us. Professor Wheatstone olverres, that 'we may walk along the brink of a precipice, or see ourselves doomed to inmediate ilestruction liy the weapon of a foe, or the fury of a tompestumi sea, and yet not feel the slightest emotion of fear; though during the perfect activity of the loran we may be maturally disposed to the strong manifestation of this feeling. Again, we may sec the most extraorlinary object or event withont surprise. perform the most ruthless erime withrut conpunction, and see what in our wakinghours would cause us unmitigated grief, without the smallest feeling of smrow :' and Cicern, who long previonsly had made dreaming his stady. instly remarks (De Dirinctione, 59), that if it had ben so ardered he mature that we shombl actually io in sluep all that we dream, every man would have to be boumd down on going ter bed. oceamally, however. in place of this parsive comdition, the emotions may he highly excitct: thas, for example, the sailors wife is apt. especially in stamy weatlen, to dram of shipwreck, and to shrick with terror from its attembnt miseries; and those who have nace in their lives leen exposed
 recalted to them in their dreams, cither with all its
 grotexptand impersh h. moxilication.

Althand the pridspusine caluses of dreams magy los soneth for in more than one direction, they are monalily in anmal reforible to sume pectiar conditime of the baly, and are wfen called into action Throush the aremer of the extemal senses. Dr Ciremery reliteo, that having mecesion to apply a buttio of hat water to his fret at holtime, he: dremmen that he vas walkine up Momit Rtha, and
 hime at hater arphed to his homet. Areamed that he was seal ped ley a jarty of Indians. In. (iizon de

## DREAMING.

Buzercinges made a series of perarranged experiments, with the viow of seenus how fir loc could determine at phasure the charactor of his dreanas. In his tirst expriment, havine allourd the lowek of his head to bu: meovered darins sherp, he thonght that he was at a rehigious ecremony in the "In'll air ; the custon of the comotry in whish for liver being to kide) the lusal covered, (xaepe on some rare onenrenees, mong which was the perfmomer

 when present at the real erremonits. De repatorl The "xperiment in two days with the samb result, In a third experinent, he boft his knems memeremt, and dreaned that he was traveling at misht in the diligence : and all travellers know, he noweres, that it is chicely at the knees that thay feel cohl when travelling ly that conveyance at misht.

One of the most remakialde phenomena of theaming, is the rapidity with which long trains of thonght pass through the mind. A drean requiring lowns lor its aceomplishment, is beron amol terminater in a few seeonds. A person whe was sumbenly aronsed from sleep by a few drops of water sprinkled in his face, dreamed of the events of an entire life in which happiness and sorrow were mingled, and which finally terminated with an altercation upen the borders of an extensive lake, in which his exisperated ennpanion, after a considerable strugde, suceceded in Hunging lim. Dr Abererombie relates a similar case of a gentloman who dreaned that he had enlisted as it soldier, joined his reginent, doserterd, was apprehended, carried lack, tried, condemmod to lee shot, and at last led out for execution. Iflep all the usual preparations, a gun was fired; lue awoke with the report, and fonnd that a noise in an alloining room had both produced the dremen and aromsed him from sleep. Dr Carpenter mentions the case of it clergyman falling asleep in his pulpit during the singing of the psalm lefore the sermon, and awakening witl the conviction that he must have slapht for at least an howr, and that the congregation must have leen waiting for him ; hat ou referrines to his palm-book, he was consoled hy finding that his slumber had lasted not longer than during the singrof of a singte line. Sir Benjamin Prodio. in his Psighlological Thruimes (1854), mentions the following ancedute of the late Lord Holland: 'On an oceasinn when he was much fatigned, while listening to it friend who was readine alom. Te fell asleep and lut a drean, the particulars of whieh it would hase ocelipied him a puarter of an hune or longer to express in writing. After he woke he found that ho remembered the beginning of one sumtence, white he actually heard the latter gart of the sentence immediately following it, so that probathy the whole time during which lie lawd slept did not neenly more than a few secomels.' Many facts of the same kind are on record, and as the author fron whom we have quoted remards, 'if we were to pursue this subject, it would lead us to some cmims specoliations as to onr estimate of time, and the difference between the real and the apparent duration of life.' It is from cuses of this mature that Lord Frougliam has feron led to the opinion, that all our dreams really take phace in the act of falling asteep or of awalime Vie cannot, however, ex]hicitly accept this doctrine. 1. There is no suthicient jroof of its beinis true. 2. We have in proof to the contrary in the fact. that it is common for prople to moan aml even taits in the middle of a sleep; and every one whu has kept a dog must frupuently' have observed him dreaming (from the ontward manifestations which he makes in the form of snarling or growlingt. though he still remains asleg. Some, on the other hamh. have argued that the mind can uever le entirely inative,
and that "vory om: is dreaming thromabont the whole ferion of slew althongh the dreans maty not fr: renemberel in the waking state. Wie jonow of mu finces that wan he alduceal in fiverme of this

 a portion of bue brimn was expeosted to view, was at prationt in lasl in the hosputal at Nomercllwo. Whan
 hum brain wian romparativaly anolumatas, and laty completely within its bomy case ; lout when the: sheof was imperfect, athe the mime was agitated lay heans, har hatan moved anl potimbed forn the skull, forming what is tormen corelamel lurnin. 'I'has grotrasion was proatest when the dromms, as the reporterd, were most vivil; and when slus was perfectly awake, esproally if actively engarest in convorsation, it attained its lighnst dowhonnont, nor did this protrusion accur in jusks, altornatam: with recessions, as if caused lyy arterial action, hot remained permanent while the ennversathon ethtimued. If the duta of this ease are to he depmelerl on, the affarance of the brain turing poofomat sleep seems to imbleate that during that state theres is a total or mearly total suapension of the mental faculties.

The anthor of Paychotorical Inquirits suggests the question: 1 Bo drams answor any purnse in the ceunomy of living heings? We regret that he has not niven 11 a very detinite answer, hut $l_{10}$ obownsly inclimes to the vew that they canaot be purpuseless. Noune has hitherto offereil any cortain explanation of the uses of the splem, of the thymid shand, or of the supra-renal eapsules; yet no one believes the formation of these organs to be murely inculental, or dombts that they have some special (althominh it present unknown) function to perform. ']hetins are,' he olserves, 'at anyrate, an exercise of the' imarination. We may well conceive that one "flewt of them may be to increase the activity of that faculty during our waking hours, and it wonld be presumptuons to deny that they may nut answer some purpose beyond this in the economy ul fer cipient and thinking heings.'

Dreams have, in all ages and countries, heen helieved in as indacations of the futme: and of ahl forms of superstition, this is perhaters the mont excusalile. Whatever is mysterious as to its cansc. and beyond the powne of the will, appears as supernatural ; and what juore so than themen! Jhu" thought's in dreans, ton, arise ont of the frast aml mesent circumstances of the dreamer. and therefore are not altugether without conneetion with his future desting, as most other onmes are. In the Homeric afe it was diridy hedd that "lreams come from Zens.' la the must aucient civilisel commmonties of which we have any becord-thwas uf leypet
 was ons uf the must important state nflices, ame was confled to a college of wise muen. A common way of eonewtme the Greek and lioman outhes (4. r.), was tur the impurer to slevp a night in the temple, after performing samificial and other rites, when his purations were supposed to ha answered in dreams. Girave philosoplers wrote treatises an the intorpretation of dreams, as they did on astru-
 interperation of dreams is mixel whth mancrons extravazances, yet speaks as if the thought that sumethins mislat be made of it. ln mordern times, aud among Luropean nations, dreams are seddom hooded exce]t by the rery ighomant or superstitious: and 'as intle as a dream' has become a provern. Nothing ean be concenved mom arlotrary than the protended rules of internetation: e. g,
"that $t$ " itream of golil is gool-hek, late uf silver ill." See Braml's Popular Antiquitits, by Dillis, where a 'Inctionary of Irrams' is siven. As to the actual comedences that sometimes harpern hetween Ireans and events, it is my surpring. comshoring the countless fancies that are passing throng one minols whue asherp, that the concidences are not ten thacs none numerons than thery are.

DRED SCOTT CASE. This was a caselmont fur timal decision inembe the surame cont of the Inited States in $18 \pi \%$, which excited monch interest in America as well as in Europe. 'The plantifl was a negro named Dred Scott, who, with his wife amd
 Emersm, in the state of Missomi. After the death of Enursm, Dred Soutt with his family clammel to be free, on the gromed that they had busidme for some time with their late ponpictor in a free temi-tory-so that hasing. as went allered, berm thee in that teritory, they cond men now be held to slavers. The resalt of the litipation was that 1 real seatt ami his family dill mit lecome free ley hawime leen taken to a free temitury and were aceordingly still hed to be slaves.
 the lontom of seas, Jivers, wh haks in urler to hrine we msters and other ammals that lie on the bottom. The conamon oyster-bedge is a bar-nct. male of iron sings. linked tergetlier to form the meshes : the month is made of sheetiron. which acts as a scoon, when the dredge is let down and drawn
along the bottom as the boat sails on. 'The dredge has of late been very extensivily used ly the naturalist with very important results, amone the most remarkable of which are those olstaned by the late Irofessor Elwarif Forles, shewing the existence of zones of animal life correspmodimg with ditiorent depths of the necan. The naturalist's aredge is if a lighter construction than that of tlu oyster-tisher, and its meshes shombl he smallar. For dredging it sumly hotom, the lest furm of dreme is one like the net nsed by the Kentish shimers. These are twine-rets, bas-shaper, imul of the length of the hoat. The lower side of the month of the net is stretched moon in warlen $p^{\text {mide, and the other side is }}$ held uphile the lower is drawn alome the hottom. The quantity and raricty of inimals drawn up by these large shrimp-nets are astonishing. The dredge nseal for catching soles is similar in eonstruction to tho slrimpenet; hat all dredges must be morified to suit the bettom on whel they are used.

DHEDGING-MACIITNE, : machine used for dearing ont or deepeming the chamels of rivers, harbmis, ise. Dreduing machines are variously constracter, the simplest leing like the oysterdromge described above, only having a perforated cowhille lar insteal of the chain-net, and a stronger -spon' in iron month to the bag. This is attached to the end of a pole, ami workml with tackle by men from a bare in such a manner that the loose matter of the bottom is somper 11 into the harge. The bucket dredging-machine is much more efficient. It consists of a long stage or framework

## DRESS-DRIFT.

Alexander's side on the height of Raicknitz, and Napoleon obtained a decided adrantave orer the left wing of the allied army, which Murat, by a skilful mancuvre, contrivel to onttlank, taking In,600 prisoners, among whom was Ceneral Metsko. Several other successes in other parts of the field determined the allied amies, especially after bearing that Vandamme was adyancing towards Pirne, to retreat, which they did during the night of the aith Angust. Dresden, howera, was not owt delivereal from the miscries of war. When Xapoleon tinally quitted the city on the Th October, nearly 30,000 men stid remained lehind. As all access was cut off by the limssians, the city nifered severely from famine. A caputuation was it length brought about (IIth November IS1:3) lectween St Cyr and Klenau, aceording to which the garrison were to withuraw ummolested from the 1ath to the l6th Nowember, on comblition that they laid down their arms. The capitulation was nevertheless rejected lyy Prince Schwazenberg. the gurison decharel prisoners of war, and treated as such. The battle of Dresile, as Alison observes. was the lust $1^{\text {itchel battle, on a seale commensurate }}$ with lis former victoris, that Mapuleon ever gained.

DRESS, the collective name for the artificial cowerings worn in greatex or less quantity by all but the most savare of the hman race, anil always combining the two abjects of warmeth and ornanent. It sems, indeel, from what wo real if sarage mations, that it is rather in the desire for mament that the wearno of dress begins, than with a siew to protection from coll (see Fasimos, umber which head sme notice will be given of the more singular caprices to which the forms of dress bave been subjected; see also Crinolive, Blomemism). The carliest coverinus would cmasist of such articles as the skins of anmals, and the leaves and inner bark if plants, which, as civilisation advances, are mostly sulplanted hy yarions textures of wowl, flax. silk, and other vegetable and animal sulstances. Some acconnt of these textures is given under the apropriate heals, amt the reculation of dress whin a view to health is treated under Health. As will be shem more fully under Fishos, the fombency in moles of iross - motwithstandine measimal aberrations-is towants simplieity ami anmondateress.
DRENSINGS, in Architectume, is a tem loosely usm tr signify mouldings amd all the simpler limids of semptureel ilecorations.
I) REUX, an ancient town of France, in the depmrtment of Eure-et-Loir, is situated on the river 1;hise. 22 miles morth-north-wrst of (hartres, and 4, m miles west of traris. It is tolerably well built, and lies at the forit of a hill crowne with the dhapidated mins of an ancient castle, formerly the fonssessiwa of the Comtes de lreve. From ainone the minas rises a beantiful chapel, in the form of a
 Eonis Philippe. It contams the tomber of two of the whiltren of Lonis Philipec, and of ethers of his relations. The town-hat anel the parish charch, both hamennme specimens of tobthie, are the only ather humburs worthy of mote. II lois exennsive

It lies in a fertile district, and consists chiefly uf one long and broad street. It has a chemical work, tlour, and lone-mills, and a considerahle corn and cattle trale. J'uls (1S61) 4000. Near D. many ancient tumuli have yielded human and horse skeletans, accoutrements, flint spearheads, whs, and a variety of ornaments.

DRIFT, in Navigation, is a techaical name for the deviation which a sliph's course receives by the action of a contrary wind.
DIIFT, a name given to the houller-clay, a deposit of the I'leistorene epoch. More fully it is callen the Nurthern Dritt, Glacial Drift, or Dilurial Drift, in allusion to its sujposed origin. For an account of the furmation, see Bobrder-clat.
Dhafr woon is wod carried ly tides and currents to a distance from its native locality. Specimens thus trinspated have been olserved in the marine strata of the Chalk, London Clay, and other formatims.
Ninhrintre is sand driven and accumulated by the wiml. Hepwits thus formed are accasionally fonnd annong the stratified rocks, lout compared with other strata they are few, though, from their anomalms character, an acquantance with their phenomena is of importance to the gedogist. Moving sames are at the present day, in many places, alkering the surface of the land. In the interion of oreat iry continents, as Arica, Iudia. and Australia, extensive districts are covered with mowing samls. The continuons blowing of a stealy wind m nue direction often curers a rich tract with this arid matronal. But the iatinence of the wind on lonse sand is most evident aloug low sumly coasts, where hills, called 'dumes,' are formoll entirely of it: they sometimes attain a considerable height, as much, for instance, as 200 or 306 feet. Dumes are advaneing on the French coasts of the Bay of Biscay at the rate of alout 60 feet per anmum, coverimy houses and farms in their progress. Similar accumilations are furming on the coasts of Nam, Cornwall,

Section of Cuhbins bandint, in Nainshime.
Wexfork, aml other parts of the British Ioses. The Cuhn Siands, in Namshire cover a large district which at a perind not very distant was rieh arable lame. 'the previling wint is from the west, hence the hilla are slowly having in an casterly direction. at the rate of a mile in sumbwhat less than a hambed yeas a singular stratification exists in these hill.: The perailiner west wind lifts, or rather polls the partielpo of sumbl up the gentle inctine of the wasturn aspert of the hill, until they reach the summit, where they fall, fomminer at step declivity tw the cast, "Mal to the angle of repme for sand. A shower comsablates the surfae of the new bed,
 very thin layer of fimer matural from the one that fuhturs, and thas, we the hill meses castward, a regular shins of stata is fommed at very high angle, as is shewn ly the diaram. The ponress of the hill is represioted by the dohted outline. Little ean be dow warest the progress of these devas. tatiar simblafts. It his been recommended to plant forer arentoin ant smilar samblowing plants, which have lome weppone rowts: they ecrainly chek to is considerable extent the indluence of tho wind.
 Bahman (f. v.), a native of Ginima, similar to the matheill, hat rither smallor and liss ferecions.

Dlillals is a genoral name for the expreises through which soldiers and sailors are prasede to quatify them for their duties. It is subinet to numerons varibties, acombing to the nomber and organisation of the men chilleal at we than, inm the Find of weapon to which the exereses relate. Thw infantry, the cavalry, amd the entillery all howe diferent kimds of drill. The militial and the voinntwers differ from the reculars, if not in the limat of drill, at least in the circmastances molur whin it
 lattalion-drill, vary buth in the manlures equecrned and in the ratine of exemises. And so liknwis. in the navy, the drillife of seamen saries in kime, acording to the duties likely to be requires.
It is sencrally considered that fone months' olrill is reanied to lit an infantry rembit for service. The progress depends greatly on the intelligence of the men. It is on this uromen that the Rifte Golanteers, eurolled in such large numbers in 1800, haw been so adyantageonsly phacel: composed almust entirely of goung men, whose intelligence has been developed ley a moderately geod chneation, the coms have advancell to a degree of proficiency which has attracted the marked attention of military oflicers.

Manats of Drill have heen preparal for all the varions branches of the two serviees. Drill-gromeds, as at Aldershott, are now sometimes maile with roufs for shelter.
DRILL, a fine linen fabnic of a satiny finish, nsed for summer dresses for gentlomen. lirils are worked with fiw shafta, oxecpe faney patemen, which are wrought with eicht shalts.
Thillhing, DRILE. Drilling is the mame applicd to the mode of suwing in regulay rows, as distinguished from broadeast sowing, ant the drill is the name of the implement emphyerl in this process: the term trill is also fremently apped to a row of drilled crop, as a drill of putatoes, com, or turnips. In all comeries in which maize and Indian com are grown, the minciple of drilling thas been long known and acted mpon. In gardening it has been pactised everywhere from time immomorial: lut its cxtension to fiele-culture is compratively of recent late. Jethro Tull invented a drilling-machine in the early part of last century, and dul much to shew its merits in the culture of grain and root crops. Since his time, the use of this implement, in the case of hoth white and grem crops, has in many districts become general. The crops which are now most generally drilled are dover, flax, cereals, beans, peas, putatoes tumip, heet-rout. cole-secel, med carrots. Of these, clover and finx are sown in drills at abont 3 or 4 inches apart; cereals from 6 to 10 inches; and heans, potatoes, and turnips at from 25 to 28 inches apart; the gemeral rule, however, with most green crops, being that the space between the rows should admit of the passare of a light plough or looe, drawn by a horse, withont danger to the plants. A great varicty of drills are now in ure. At presurit, that fromed on the principle of lifting the grain in small curs, which emery themselves into tin tubes, hy which the srain is conducted tu the condters, is chiefly nsed in the level parts of England. (iarrett of Saxmundhan, Sufdolk, a cut of whose corn-drill is given, and Horusty of Grantham, are favourite makers of corn and turnip dralls. The menal Enslish Mrills, howewer, are tom haty for the uncern sol of a great part of sontland, and consenuently a hater, Lut othervise less prifect machine, of a simbar nature, and more suitable for hilly laud, is male in
the Lethians. One powerfin recenmembation of Mrilling is, that by mams of it a considmalde satuige of seed is ellioctori in the sowint of ohito rrus, lat the preat alduatame is, that in tho case of aren

"arrett's Corn-irill.
the land, both by the hand and by the lerise-hen Drinling is of more impontane in dry than in mant Clinates, as in the fromer, werds are name ape th smine upand injure the crops. To krop the an stmen and pulverised, which cin only bu prapmes done where the crops have been ifmed, favome: the retention and alisorption of the maketure In
 sited hencath the surface, springs up with "reater perularity the straw is stifler, and the ermme is nure easily cleancel matal the crops ener it fully,

In bugland, turnins are irequently drithei liy a macliae on the llat; while in seotame, they are always sown on rilpes ar inills fermed loy the dombide-moulder plomh, which, in romsequ-nee of its leine used for forming wike rillers on wheh the turnips are sown, is called also the irill-phond. Some turnip, sowinsmachines or drills are so conetructed as to be able to derosit mamere and simal at the same time.
DERLLLA are torls wed for boring or irilling hooks in metal, bonc, svory, hard woods, \&c. Thery are misually made of a square steml har, flattemed ont at the cutting end ; this fart is brought to an ancolar point like of spar heal, and the onttine ellos froming the angle are bevelle in opposite durections. Thase which have a projecting pin in the contro. and chisel-shaped cuttury chlos on each side of the fin, are calleil 'centre hits.' There are vainus comtrivances by which the dill is made to revolve. Fir drilliur iom, sted, aml larue lyass mom, the lathe is commonly used, the drill bemer hatem into a sfuarebole chack, and the work pressed against it while rewlving hy the screw and contre if the pappot. The motee or drill-strect is commonly used by carponters for centre hits, ami recasionally for metal work. This is a rurvel hamble, which is made to rovolve by the hand, while one end is pessed against the chest. Small mialls for metal work are monnted with a firulnor pulley, or are fitted into a stuek with such a pultey on it : a pace of cane or spring-sterl is momed with a string like an archer's bow, luat lone enonsh to wind romal the fermle. liy drawing the buw lenethwixe, the drill is made to revolse amb is at the same time pressed against the work by means of a broms'r-mtut. which is held agrinst the chest of the workman: this breast-phate has indentations mpm it, which sore as soclaets, inte wheh the end of the drill-stock or drill works.

 fail to lac obsorved, that just in fromertion to ath increase in the number of emfortable lanes, the cultivation of mental resomers, and the sprow of a taste for harmless remeatums, the more orions of the old eonvivialities lisappear, Latterly, many amming tralitions respeting the drimking lablits of a past are in Noatland, whore they longesi lhomished withont alleation, have beon niven in the Momoiss

 Jiamsay ( 18 sion ).

As regards miscellanems drinking observaneus at one time conmon, we can rofor hat to at in of the mome prominent. 'erlaps the most allensive of all was that costomary among tradesmen of impsing fines to te consumed in lipurs. Apprentects. on beine introduced to a workshop, paid somuch entry-mency to be spont in drink, and simila wactions were made from jonrneymen an conterins a mow compayment. This was called baying theme fortiog. When Benjamin Franklin, on his gettine employmant in a printing-otice in Iondon, refused to comply with this mischievous custum, he experienced, as he tulis nis, a variety of petty amomances. Among shipwrights, the penalty if nom-payment was Hugsing with a hamdesw from time to time and nother maltreatment. We refer to Imalopis Mrimking C'stetps of Grat britain (1839) for many curions details of hais kime. Haprily, the abolition of these mangos has kept pace with the incrasing intellimence of the wowing-classes, and of suld motraces litile is now heand. Trisomers, un heins lonlset in jail, as ratated in the novels of smollett and others, were whiged to pay sumish for drink to the lirotherhood of which they hat become members. This pitiless exaction is now totally fome, thongh the eflicacy of modern mison-lisciphe.

The giving of rails (Lat. mold, farewrll) to servants on quitting as gentleman's homse; which lacame so intoleralle in the 1Sthe e., as at lansth to he given up by miversal consent, meant, dunhtless, a sitt to be spent in drink to the halth of the chan, and was analegons to the custom of rivine a trimk-geld in Gemma, and a pow boipe in France, to sersants, drivers of carriages, and others. There ware, at whe time, numernis drinking usaps connectel with departures. We neal anly notioe the bumpilie ( Pr . beon celles), or, as it is smetimes callen, a foul (Fr. coit), a fostive Irinking at the away-soms of servants or of persons in a still higher elagre, once common in the Lowlands of Eicotlant; also the sfirup-enf, "H, as it is callent in the JTighlamp, Wach an dompis, or think on getting on horseback. and being reuly to set ufl- For the moral and physical erils emmeted with drinking mangus, ame the means taken to realress them, we refer to the article Tempenance.

DROME, a department of France, on the cast bank of the Ithone, to the smuth of the dapariment of isere. Area, 0496 square miles. Pop, s24.760. In the west of the department, runuing from north to sonth along the Klone, stretches a sandy plain of from five to eight miles in breadth, hat toward the cast the surface is hilly; a spur of the Alps traversing the eastern houndary, and sending offshouts of about 3500 feet in average height westward across almost the entire area of Drome. These heights, whose sides are covered with forests of pime, oak, and beeth, atfurl excellent pasturage in summer and antumn. The general direction of the rivers if $D$, is westward, toward the lhone, and the most notable of them are the Drome, from which the department takes its name, and the Isere. Vines and malberry, chestnut, walmut, and olive trees are extensively grumn. Alout $\$, 600,000$ gallons of wine are promed annually. Many of the sineyarts are famons, but perhaps the most celebrated is that of L'Hermitage, near Tain, on the banks of the dhone, which yiells red and white wines hardly surpassed lyy my in the world. I). has several ironmines, also curper, lead, and to some extent coal The manufactures consist chiefly of woollen cloth, silk, hosiery, serge and cotton yarn. The department is traversed by the Lyon :and Avignon Rail. way. It is diviled into the four arrondissements of Valence, Montelinart, Dic, Nyous, with the town of Valence for capital.

DROMEDARY, a name sometimes given, prob. ahly at first through mistake, to the Arabian or ane-humped camel (Camelas elromedurius), bat proInerly belonging to a variety of that species, distinguishel by slemilerness of limhs and symmetry of

form, and by extraordinary flectness. It has been well describish as 'learing much the same relation to the urdinary camel as a race-lumse or hunter does to at cart-horse.' 'The word dromedary is derived from the obsolete firme dromo, to mo. The pace of the 1) is a trot, which it ean maintain withont interanswion for a promigus longth of time; often at the rute of nine milis an leme for many hours together ; Whilst a jouney of ubwaris of boomiles is performed at a smowhat slower rate in tive days. bexn its more rapid pate can be manataned for twenty-funr hums at a stretch, without sign of Wariness and withont stopping to lait; and if then it is alluwn a litthe refreshment, of a ball of paste mate of barloy and pawderal dates and a little water or camel's milk, it will resume its journey, and for with matiminishas sped for twenty-four hours more. The jelting to the rider is terrible. The rallop is a pace umsuitallo to the 1 ., and at

## DROMORE—DROUYN DE IHUYS.

which it very sonn fails. Dromedaries are some. times trained to run races. White dromedaries are particularly prized in some parts of the lust. See Camel.

## DRUMMOND-DRUPE.

Here the knowledge of Irish character and feclings which he had acquired in the survey was of great molvantage to him, and by his impartiality, somel julgment, conciliatory disposition, inderatigable chergy, and hearty devotion to the work hefore him, he at once gained the confidence and affection of the people. It was in a letter written by him to the magistrates of Tipperary on the e2d of May 1835 that the memorable worls occurred- 'Property has its duties as well as its rights;' an aphorism which instantly flew over Ireland, and contmues every. where to exurcise a wholesome intluence. But it was perhaps as the hear of a commission appointed in 1836 to report on a railway system for lreland, that I. rendered that comintry his greatest service by the admirable Report which he hat the main labour of producing. So far as the routes recommended have been follored, the expectations of the commissioners have been fultilled or excecded; and it is the opinion of good judges, that it would have loen well for Ireland hat the carefully digested scheme been more fully alopted. By these multiplied labonrs, howerer, D.'s strength was usertasked, an he sank on the 15th of April 1540, amiust the grief of the Trish people, and of his intimates in public life, who had hoped to sec him rise to some of the highest ultices in the state. A statue by Hogan was crected to his memary lyy public subscription, in the hoyal Exchange at Dublin: and a memoir of his professional life (atmitged in Finight's English Cyclopadia of Biograyhy, ii. G47) was published in 1541 by Captain Larcom, li. L., iu the 4th volume of Papers on Sulljects Connected with the Duties of the Corps of Royal Engineers.
DRUMMONT, Wiellam, of Uawthorides, a poet of consideramle celebrity, was descended from a very ancient and nolle scottish family, and was born 1:ith becmber 1585. He was whated at the High School of Elinburgh, ancl afterwards at the University of that city, where he touk his legree of M.A., July 2-27, 1005. On leaving collere, he was sent to the emtinent in order to study law, for which he cxhbiten great aptitule. He returned in 1609, and his father dyins in the following year, he retired to the patemal estate at llawthomien, which, aceort. ins to the leamed limdiman, "was a sweet and solitary seat, aml very fit and proper for the muzes;' and there, with an interval of eight years of foreign travel, spent his life in his favomite literary pursuits. He died thl December 16t9: his 1hwth, it is sam, being hastened by his excessive ariof for tho fate of tharles 1 .
llis pincipal worls are the following: Thers on the Denthe Modiates- Prince Benry, sun of James 1 .
(Elin. 1613): Poems: A morvas, Funemll, Divine, Penstorull, in Somets. Sonys, Sestains, Mutriguts (1616) ; Forth Frastiong, a Panequricte to the King's
 Tokemo Midhiniu ( 1 sforl, 1691 ). A niw edition of the works of D., with Life liy Peter Cumincham, was pmblisher in S解, and :mother by W. 13. '1"umbnll in 1sini. His literary celchrity gained him the chase fricmbhip of many men of eminence, amme whom may be mentioned Niehatel Drayton, :wn the 'rare' linn Jomson. 'The latter, in the wintem if 1618 -161!, travelled down to haw(thmalis to vist the puet, and it. is now periaps

DRUMMOND ISLAND, within the limits of Canada, is in Lake Huron, leing the most westerly of the Manitoulin chain. it measures 20 miles hy 10, and lies about 30 miles to the east of Mackinaw, an island in the strait of the same name, which pours Lake Nichigan into Lake Huron.
DRU'MMOND LIGHT, or LIME-BALL LIGHT. The heat given ont cluring the combustion of a mixture of hydrogen and oxysen gases, or of coal-gas and oxygen, is very intense; and when the mixture is directed on $2 n$ infusible substance such as lime, a most brilliant light is evolved. Captain Drummond, R.E., originally proposed the employment of this light in the trigonometrical survey of Great Britain, and constructed apparatus for its production. See Drummond, Thomas. The most convenient form of the apparatus is represented in the forure, where the mixed gases escaping ly the jet $a$, being set fire to and made to impinge upon the cylinder of lime b, raise the surface of the latter nearest the jet to a white heat, accompanied by a dazzling light. As minute portions of lime become detached and are volatilised from the spot on the lime on which the jet of buruing gases strikes, it is necessary to expose a new surface of lime to the gases, and for this
 1urpose the screw $\cup$ may be tumed by the hand or by clockwork. The hydromen and oxygen ought to be confined in separate gas-holders or bags, and to be brought by different tubes, $H$ and $O$, provided with separate stop-cocks, to within a short distance of the exit jet. The common tube through which the mingled gases pass to the jet is about six inches long by twothirds of an inch in diameter; and in Mr Jlemming's construction the tube is very elosely pracked, full of very tine hrass wire, which is afterwards wedged in by a stont wire heing driven down the centre. The wiject of the fine wires is to prevent the return of the dlame, which might lead to a disastrous explosion. When the rays from this light are concentrated by a parabolic reflector, it can be seen at immense listances. Thus, on the 31st December 1845, at hali-past :31.m. (dirylight), the light was exhibited on the top of Sheve Donaril, in county Down, and was scen from the top? of Shewhon, a distance of 108 moles; and in ather instances the D. L. has been seen at distances up tor 112 mikes. The employment of coalrgas insteal of hyolrogen has greatly increased the applications of the 1). 1., and it is now often used in magic-lanterns and other apparatus where great brilliancy and penctration of light are required. Dy its hilliancy and want of colonr, it cnables the photographer to work ly might as easily as hy day. Gerat cantion should at all times be exercised in the propartion, storing, and employment of the gases, ha may dimgerns explosions have oceurred. Little hat is evilual fiom the D. L., nor does it vitiate the surromaling air, or consume its oxygen.

IHRUIde, in liutiny, a sumentent fruit containing a sinde secel or hernid, usually euclosed in a hard
'stone,' the malocerp. The sucentent part is the mesocarp. Examples are faniliar in the fraits gencrally known as stone-fruits, the puch, phum, cherry, \&c. In the ahmond, the mesocary is not succulent, yet the fruit otherwise prosessing all the characters of a 1)., receives that name. It may be regarded as intermediate between a $D$. and a mat. The fruits of the genus Robus (liasphery, Bramble) are compond of many suall arsergated drupes, upen a common recoptiche. Thed date is a 1). in which the haral "stone" is represented by a nembran:

DHURY, Dre, a goldsmith, silversmith, and cutler, in Luadon, where he was lorn, 4th Fobruary 1725; was devoted to the study of cotomolugy and the collection of exotic insects. His Illustrutions of Exotic Lintomology (2 vols, Lond. 1773-1752), a work umrivalled at the time of its publication for the accuracy and beauty of its thgures, is still in high repute as a look of reference. D. was also assiduons in his endeavours to acquire infermation concerning the habits of insects. He died 15th Jamuary isot.

DRUSES, a remarkable people who inhabit a district in the north of Syria, comprising the whole of the suathern range of Mount Lebanon and the Western slepe of Auti-Lebanen. In this district they hold exclusive possession of abeut 40 towns and villages, and divide the possession of alout 200 more with the Harenites (q.v.), while bo villages in other parts of Anti-Lebmon are peopled by them. The inhabitants of the Lebanon affond a remarkathe ilhastration of the amalgamation of races. After the second captivity of Isracl, Lsarhaddou repropled the wasted strengholds of Samaria with eertain fieree tribes, some of whem, called in the scriptures Cuthites, and kuewn in subsequent times to the Greeks as Carduchi, and faniliar to us as kurds, settled in Lebanen. From them the present J. are sumposed to have originally sprung. Nore than a theusand years later, a fresh colonisation took place. The Mirdi, a warlike trihe who dwelt to the north of the Caspian, originally of Persian extraction, were transplantel thither ly Constantine IV., in 686 A.t., to the mamber of 12,000 , to act as a bulwark against Mohammedan invasion. The Arabs also, in sweeping through the mountain-fastnesses, left a permanent impression there. Thus, Cuthites, Mardi, and Arabs, or rather Nohammedans of variens races, have combined to form that strange being - the medera Druse. It has also been supposed by seme that there runs in his veins net a little of the llood of the Crusuders, but this is doubtful. No immigrations, however, of any importance into the conutry of the Druses trok phace after the clese of the lotl c . and this period suems naturally to cenclude the first great section of Hruse history.

The matienality of these momataners having anw been consolidated, their pectiar and mysterious religion besan gradually to be developed. llaken Biamr Allath, or Bemrillah, calif of Eggyt, and a Nero in ernelty, was the author of this system. He affirmed that he was the representative of God, ond, having entisted his confessor, I arazi, in his canse, he prepared to proprond his doctrine. In the 107 th year of the llegira ( 1029 a.b.), the dirine nature of Hakem, wr rather the incarnation of the Slirit of tind in him, was pmblicly amonnced at Caire. This reselation, lanweser, was unfavourably received by the mol. Hakem's confessor, Darazi, marowly cscapme the fate of a martyr to the impostures of his master. Retiring, however, to the fastnesses of the Lebanon, he there began to inculcate the principles of the new faith; and altheugh he
never acquired any mastery owor the sympatines of the momntainerrs, he at least luft his name (1, them; for there can be little doubt that the name Inases is derived from that of Darazi. Hamze, a l'ersian mystic, and successivily thre disciple and vizier of Hakem, introducol into the: newly fermul atori religion all the clements of attra tion and strength which it jussesuns ; and him the 11 . vonerate i. the actual formeler of their fivith.
The 1). form ono of the vory fow sects ammo. Whom inowelytism is diserarasend. They arre remand. ahle conservatists. F'ur suo bears they have maintamed in distinct religions and political iud"pmatense and nationality. Into their faith the dinctrines of the lentateuch, the Christian gospel, the Koman, and the Sinf allegories, are wonderfilly interwown. They reject, however, the seven pints of lalamiom, substitutiag for them the following seven :-1. Seracity (to each other only) : 2 . Mutual protection and resistance: 3. Lenunciation of all other religions; 4. Profession of the unity of diaken as ciol; ; Contentment with his works; 6 . Sulmission to lis will: 7. Separation from those in error, and from demons. Thoy luebeve in one Gonl in whom there are no parts, to whom they ascribe no attributus, lefore whom the tongue ceases to utter, the eyes to lechold, lat who has revealed himself ten times mon the earth muler the form and name of mortal men. In Hakem, so Hamzé taught, had Gorl revealal himself for the tenth and last time. They also believe that the mumber of existing souls never varies, and that all the sonls in life now, have lived, vested in some human form, from the begiming of the work, and will so continne to exist till the end of it ; that when a man dies, his soul puts on a fresh hamanity, which occupies a rank in moral dignity correspending to the purity or impmrity of the past life. But although they believe, in this sense, in the transmigration of souls, they also belicve that after the laise of ages, when the soul will have been purified from every stain, there will ceme a jeriod of rest. As a religions body, the D. are divided into two classes: the Akals, or those initiated into the Druse mysteries; and the Djahils, the minitiaten, The former do mot adorn themselves whth gold, or wear silk, embreinered, or fanciful girments; they forbear nsing wine, spinits, tobaceo, and other luxuries, never swear, utter ohscene lamynace, or lit. The latter are free from all religieus dutios. But, however rigid the profession of the Akal or imitiated Druse, he is tanght that his practice may lre conCucted in seme cases on the princinle rif expediency. To be truthful, he is taught, is desirable ; but when concealment is necessary, then equirocation, or even falsehood, may be practised.

Jrevious to 1840, Mruse and Maronite lived on terms of intimacy and friendship. At that perion, however, dissension sprung up between the two tribes, and maval to be the intrometion to years of intermittent warfare. The strife reached its climax in 150\%. From May to Octoler of that year. acconats of the farful harbarities prantism by the 1. unon the llaronites followed earh other with appalling frequency, until the indignation of Eurne was moused against them: and in Aucust of the same year, nn expedition was scut ont from France to Syria, with the consent of the Great Inwers, for the purpose of protecting the Christian residents and the so-callen Maronite Christians, and of restornge tranquillity. But by the efficial despatches of IS60-186i from Her Majesty's eonsuls in Syria, it was clearly froved that, in the words of Lord Daterin, buwever criminal may have heen the exeesses into which the Drases were hetrayed, the original provocation came from the daromites, and that they are themselves, in a great measure,

a slight aditional labl, they arw rady to brak off ly the wall: and the pexses of destroction has often gone far withont a sugneion boing "ntartaned of anything wrong. 1)ry wot is weasional loy fount, the myetium of whind difluses itself thementhe substance of the timber, destroniug its toxtures and reducins it to a fragito or iven fmahb mass.

 monly productive of this mishatef; the linst hemes the most common and fommilable dry wot hande in britain, and the last having the stme prominnome in (iemmany. Its Cemuan mune is /homomelhamm. Other fumi, however, produre thr same romets where nome of these are presint; hat hosides the species which are well asentinnel, there are shac
 dry rot, of which it is muertain to what fompus they oucht for be referma, ats they have not lown observer to develop themselves in any pertect forme, whilst also it is nat known what illferent manditieations of alyearance the myedime of the same fungus may exhinit in dilliarent eiremmstances. Vray destmetive ravages have Jnen ascribed to ditherent species of Sporotridhm, particularly in the amal yards of britam; lont the genus is altogether a donbtful one, ani not improbinly consists of mere forms of maderdined myedinm. Several specins of fung are often present torgether in timber attected with lry rot. some of them lemetrate demply intu the sulstance of the timber, others spreal more superlicially, but attract moisture from the athonsphere, which hastens recery. This is the case with Merulius lucrymans, which first aphears in sumall white points; a filamentous sulistance radiatins from these gradually forms brow patelues, stmme times many feet in diaureter ; from these long crepping slumats often proceed, and a mot-work of filanments peuctrates into cvery crevice. 'I'le species if Polyporus more gencrally fill the whole mass of the timber with clelicate filaments, which ilestroy the cohesion of its fibres. Dondeletyutecinu appears in the furn of leathery lamine, often in the strungest oak, and the delicate thentals of mycelimu pene trate every duct ami cavity, reducine the whole to a fungons mass. Deantiful oranre tufts sometimes appar, supposed to be the myedinn of species of Cominus.

Of the causes of dry rot, stamation of air, as behind a wainscut or unker a firme, is evtanly one of the chief, and a knowlempe of it surgests mons of prevention which may often he ensily and most adrantagensly emplayed. Another principal cans. is insufficient drying of the timber itself; and much of the prevalence of dry rot is not improhably due to the practice of felling ank in sprine tor the sake of the bark, when the word is full of sap. Any circmanstance which may temel to renker the say acidulous, greatly increases the lialility to dry rot. The prodnction of fundi takes place with masual rapudity when by fermentation or otherwise an acidulons condition of organic substances is porduced. I fermentation and chemical change in the alhmmons comstitnents of the worl, is not improb. ally the immetiate canse of iry rut, providing a soil suitable for the besetation of fungi.

For the prevention of dry rot, varims processes hase recently lesun to be employed, the ohject of which is to "till the pores of the woon with some chemieal substane Sir Willan Jimentt nsed chluride of zine; Mr Bethell nsed creasute: and Mr Payne, lime, wath silicate of potash. The jwows most gencrally an prosem, and apparently mest snecessful, is that of Kyan, ealled Kyonisim! ( 4, 8.), in Which a solution of corrosive sublimate is intrednced into the pores and eclls of the timber ley means of

## DRYING-MACHINES-DU BARRY.

immortally revenged limself on the witty and protigate duke in the Absalom und Achitophet. This manditicent satire arose out of the pohtical commotions of the times, and is an elaborate defence of the king against the Whig party. Charles II. is Deridl: Monmonth, Aldsulom: Cromwell, Suul: Buckingham, Zimit; and Shaftestury, Achitophet. lts success was amazing; it ran throngh five etitions within the year. This great poem appeared in 1681 ; and enraged at its success, 1 .'s enemies hovered aronnd bim like a cloud of venomons gnats. In the same year he pmlishet The Medul. Elkinnah Settle, one of the most virulent of his foes, replied with some offect; and I)., thoroughly roused, issued next year the Muc Flechooe, and the second part of Absalom ctul Achitophel. These satires were as oserwhelming as the Italian lattles of the first Sapoleon; 1 .'s enemies were crushed for ever, and he remained during his lifetime the undisputed king and lawgiver of English laterature.

After the deatli of Charles II., D. became a convert to the Foman Catholic faith. This event was amounced to the world by the publieation of The ILind and Punther, in 1657. For this change of faith, he has beew much alnset. Macaulay ealls him 'an illastrions renegale.' Mr Bell, his latest biographer, strennomsly defends his conscientiousness. At the Fievolution, he was deprivel of his lanreateship, and somewhat straitened in circumstances, he fell back upon his old oceuration of writing for the stage. His translation of Firgil was begun in I69t, and completed by the close of 160\%. A month after the publication of lirgil, appeared the Jde on Alexamler's Feast. In 1695, he commenced his Publes, and completed them in a year and a balf. His last work was a masque, with prolugue and epilogue. He rlied on the 1st May 1700, and was buried in Westminster Abbey, where a momment was erected to his memory ly John, Duke of liuckingham.

Although the great bulk of D.'s works are compused of plays, and although these are, for the most prart, levoid of character, feeble in sentiment, false to all external nature, and cxaggerated in expression, Te remains me of the prome glories of Eughish literature. Ilis Satires and his Fables are masterpheces. In these, he is ahmost always masculine and natural, and his versitication flows on broad, dee], and majestic. Nor is be famons only as a writer in rerse; in his prefaces, and his Essoy on I)ramatic Posy, lee moves himself to be a master of what he so tincly cialls 'that other hamony of prose.'
I)LVING-MACIINES. The ordinary process of hrying clothes amb fabries by exposure in the ofen arr, has been found too tedious for the blewher, dyer, and for large lamdry establishments; and hot-air chambors have been extensively used; but a mat inamorement has been lately made by using the proneple of centritugal force to throw off the greater part of the moisture. The drying-machine eammonly used consists of two drums or eylamers (on'm at the Lop, the inner whe, into which the goods aro packed, is perfuratod at its sides, aml made to revolve witl great velucity cither by stean, water, w' hamb-power. 'I'lo action of the arying-nathine is preciscly the sanme in principle as that witnessed whan the homsemat is trantling in mop, or of the dog when he shaties himsilf un cominis ont of the water. It he use of the onter eylinder is merely to eatch thor drops of water thrown wots and prevent the inmomenence that wald resmlt from its distriintion throukh the aprartment. A pipe connceted wh this outor drom carries the water away. J"he drying is mot, luwner, fuite completerl loy smek
 porceptilio to the douch if the gouds are [ressed
against the cheek, still remains. This is ex]elled by open-air or hot-chamber drying. These dryingmachines are commonly called 'extractors' $1, y$ dyers. A simpler and cheaper drying-machine has been lately introdncer for domestic use. It consists of two woodeu rollers monnted parallel, and one above the other, with an adjustment to vary the distances between them. One end of the article to be dried is inserted between the rollers, which are then bronght as close as possible torether, and one roller is turued by a handle, the other, being free to revolre, turus also as the clothes pass between them-the moisture in this case being extracted by pressure, as in the common process of "wringing.'

## JRIING OILS. Sce Oils.

IH Y'NESS, a technical term in painting, used to indicate a style in which the drawing is hand, angular, and formal, and the colour deticient in harmony and mellowness, thongh not necessarily in power or richness. The earlier works, both of the Italian and Flemish schools, all more or less [artake of this defect; and it is the most mominent characteristic of those of their imitators to whom the name of pre-Faphaelites has been given.

## DRYOBA'LANOPS. See CAmphor.

DRY'OPIIIS, a genus of serpents of the family Colubribu, allied ta" Imentrophis, and, like those of that genus, of very elougated form, and living mostly among the branches of trees, but distinguished by a projecting muzzle-a curions prolongation of the upper jaw, which in some is slender, in some leaf-like. They are natives of the Last Indies, Madagascar, and tropical America.

DRI'-POINT, a sharp etching-needle, used to incise fine lines in coprer, without the blate being covered with etching-ground, or the lines bit in by acid. See Engraving. The work produced by the dry-point is not only very delicate, but it wears less in printing than lines produced by the action of acik. Fairholt's Dictionery of Art Terms.
$\mathrm{DU}^{\prime} \mathbf{A L}$, in Grammar, is the form given in some langrages to a noun or a verb, when only two things are spoken of. Thus, in Grcek, pater is father; putere, two fathers; pateres, fathers. To have a dual number in addition to a plual, is often spoken of as a retinement of langnage. It argnes, however, a higher degree of abstraction to be able to concerve every sulject as one, or more than oue, than to require three classes-one, a pair, and more. Aceordingly, it is only in some of the more ancient lanomages that we find traces of a dual number, and it liecomes lost as the power grows of analysing concrete impressions. Sunserit, ancient Greek, Arabic, and Hebrew have the dual number, the last only in nomus. Nodern Grcek has lost the dual. The moly trace of it in Latin is in the two words cluo, two, and ambo, hoth, It is wanting in the Cemmanic languares, with the exception of the ancient Gothie, which had a dual form of the verb. In Augh-Sizon, the'te was a separate form of prommin for 'we two' (u'it) and 'ye twu' (git).
I) ${ }^{\prime} A I A S M$ is the mame given to a philosophical thoory, necumlins to which some two principles, of dalionet nature, origimal, and incapable of being lerabal the whe from the other, lie at the bottons of "verythmis; as, for example, the ideal and tho mal, or the material and the thinking substance. In a narrown and thoolorieal sense, daalisn means tha assmuption of two ordginal beings, a good and ant evil, as in the doctrine of Zoronstor, or of two distinct principles in man, a bobbly and as spiritual 'I'le olynsite of dualism is Monism.

JUt bikliy, Marif Jhanne Gomard de Vaublhafer, Comtesse, favourite of Louis XV.,
was horn Augnst 19, 17:6, at Vaucouleurs Her mother was a dressmaker, and her father, of rather her reputed father, was an exeiseman mancl Vaubermier. After the death of lur father, she stayell for some time at a combent, lut lift it when fiftcen years of age: went to liaris, and assuminy the name of Mademoisclle Lange, sucereded in mataingy employment in the estahlishunent of a fashimable milliner; lont in a short time renomond all homest ocenpation, and forming a connetion with a discepatable house, met there the fornte dem lm lamy me of the most noted rouis of his day, who made her his mistress. This jerson afterwarls introducel her to Lelech, valet-de chambre of douns $\mathrm{XV}^{\prime}$., who presented her to his royal mastars, then marly 60 years of age. She was at this time remarkahly bandsome, to some "xtent witty, amb han a frankness, or it might be, a vulgarity of mamur that amused the doting monarch. Desirous that la petite Lange shoud obtain a title, and be introducced to cou't, Louis prevailed upon Come Cuillame Dh Barry, brother of the comte already mentioned, to marry, and thereby confer his title upon, the favourite. Aceordiugly, in 1769 , she was presented to court as the Comtesse Du Barry. After this perion, many of the most powerful conrtiers abased themselves before her. I'Aiguillon became hur confidant, and in concert with her, ruled the loting king; the Chancellor Maupeon elaimed a remote relationship with her, and by her inftunce succeeded in dismissing and exiling the parlianent in 1771; the Abbe Terray, eomptroller-seneral of finance, was suave to her, though insolent to all the rest of France. At no perind, perhaps, was the court of France nore openly and ontrageonsly immoral than during the supremacy of this strumpet.
On the death of Louis, however, in 1774 , Du B. was dismissed from court, and sent to live in a convent near Meaux. She was afterwarls removed to ber residence of Luci-nnes, and while living there was allowed a pension hy Louis XVI. Some time after the ontlreak of the Revolution, she went to London to dispose of her jewels. On her return, liobespierre caused har to be arrested, July 1793. In November, she was tricil before the Revolutionary Tribumal, and aecused of 'having wasted the treasures of the state, of eonspiracy against the remblie, and of having, in London, worn mourning for the late ling.' She was comlemned to death, and was sent to the guillotine 7 th December 5793 . Uf all the women who mountel the scaffold during the Revolution, Du B. exhibited the least courage. She implored the 'good people' to deliver hor, and Mousion the execntioner to prolong her miserable life for one moment only. The single grood thing that history records of her, is her patronage of various artists and men of letters, hint thero is little reason to believe that it originated in anything higher than her dread of epigram and caricature. She had neither taste nor knowledge, and cared only for scnsual gratifications and excitement. It is estimated that she cost France $35,000,000$ francs. The Mémoires published under her name ( 6 vols., Par. I $899-1830$ ) are not reliable. The unly work, it seems, which can be consulted with conifidence is Lacretelle's Histoire de France pendunt le 18 me sitele.
DUEI'TZA, a fortified town of European Turker, is situated on the northern frontior of lesnia, on the right bank of the Ima, and at a point about ten miles from its confluence with the Siwe, of whieh it is a trihutary. Luring the 16th and 17 th centuries, it was a bone of contention letween Anstria and the Porte, and was repeatedly lost and regained by the latter. It is chicily notable, howerer, for its heruie Lut unavailing resistance to the Austrians in 178 s .
I) was suhsequently restored to the Turks, to whom it now lelengs. l'op. Gown- - ower against Turkish J., on the 'lगmsitn hank of the Coma, stimeds Austrian Duhitza, a strmely fortifich market town in Austrian druatia.

DU'BLIN, a maritime wonty in the rast of Lanster Province, Irelame, anf rombaining tho metrop lis of that comery; Jommen, N., be Meath; F., loy the Jrish keat; Si, by Wicklow; anil W., by Kildare ame Meath. It is the smallest lut two of

 the are arable, and 'roth in woul. 'The yonst, from its indentations with crews and lays is 70 mikes lome, and oft it lie sevenal islay. Imblin blay, one of the dinest in the kimghom, is 6 miles linam, 6 deep, with : sweep of 16 miles. It has two preipitous hills, abont 500 foet high at its nonth aund south rms; lut the heal oi the bay is low ame samp: The corst is defumbel ly 26 martello towers. Thes surface is mostly a level rich plain, with slight undulations, but rising in the south in a hill-range, the highest, point of which is kippure, 2473 feet. North of this ramee the only proniment eminences are Lambay lsle, or lreland's Lye, and Ilowth Head, 503 fect. The only river of note is tho Lilliy, which rums throngh Dublin city into Dublim Bay. The Royal and Crand Canals run west thomg the comaty, and unite the Liace and the Shtamon. The chief roclis are carbmiferons limestone, granite, and sone metammplic rocks and premstone. There are copper and leal mines near Scal]. Fublersearth and putters-clay oecur. Iron and manganese are found on Ilewth peninsula. dranite and limestone are much used in luidding. There are many mineral sprines, including ten saline purgative ones, within the city of Dublin, and some tepill ones of $75^{\circ} \mathrm{F}$. The climate is mild. The smil is generally a shallow calcareons gravelly elay. In the north and west are grazing and mcadow farms, and around Dublin city, villas, kitchen-gardens, daives, and museries. 11. is the lest cultivated comuty in Ireland. In 1S5S, half the county was in crop. The chicf crmps are oats, wheat, and potatoes. There are impertant fishories ahny the coast of turbot, brill, soln, plaice, cod, ling, haddock, whiting, and oysters. The manufactures (chiefly of cottons, stockings, and embroidered muslins) are mostly contined to the city and the vicinity of the noctropolis, aud are of more value than in any other Irish county. Balhrigen is famed for its hosicry. The chief exports are from Dullin city. D. is divided inte 9 baromise, 4 bur-law unions, and $S 3$ parishes. The chief towns are Dublin, the eapital of Jrelam, and kimuston. Pop, exchasive of Dublin eity, 15:13, 140, 10:7; 1551, 140,731. D. is the only luish comenty whise population increased between $18: 31$ ami 1st1, and from 1541 to 1851. In 1851, D. hal 145 matimal schools, wath 27,2 scholars. The county sends six members to parlia-ment-two for 1). chanty, two for Dublin city, and two for Dublin University. The manners, alpearance, dress, and cabins of the lower orders of $D$. county difler less from those of the interior of Ircland than would he expected from the vicinity to the metronds. "Thore are numums antiquities in differcut parts of the connty. ( 15.1 - poje 160,000 .)

DUBLIN (himh, Muh-linn. 'hack pool;' tho Lblume of 1'tolumy), the capital of lrelam, stands on the river Litles. where it disembernes into
 IV. It coners an ara of 1300 acres, but its parlia. mentary boumary amprises an area of alout 5010 acres. and its muncipal bonmary mealy 4000 acres. Much of D. is Luilt on land reclanod from the sea;

## DUBLIN

and the groum is genorally that, with a vory fow umbulations, scarce deserving the mane of hill. The river, running from west tu cist, divilles the eity into two almost equal purtions. The aristucratic jarts are the smath-east and uroth-east, containing many ] The contre, and the morth-west quarter are the great cmparmas of trale, and the residence of the mikhe classes, many of whom, lowner, have their private housen in the sulnmbs. The sonth-west mivision, berrt of which is called the 'Lilnertios. (nare the seat of the silk trate, is the mont dilthy and decrablerl furtion of the city. 'She struets in this quarter, which is the ndest part of the town, are narow, cronkel, and irresular, while in the fashionable purtions they possess a totally "rnmsite charatere 'The city is surrommed by a '(ireman liond' of nearly nine miles in lennth, which forms a favourite Walk and elrive for the infabitants. 'The dianter' of this roarl is about $2 \frac{1}{1}$ miles.

In the newer parts of T., the streets run at rioht angles to we awother, and are remarkabho for them lometh and the unifomity of their arehi. tecture which, howerer, is so varmel as to arobll monotuny, 'The most imposing thas is sackville street, whel is perpenificular to the river. It is lot feet laroal, and nearly 700 yarls loug ; at its north whe stands the liotundia, with lintland Signare-in its contre, the leantiful lonic portico of the Genoral I'ost-offere, and Velson's Monument (nuwards of $1: 30$ fect ligh)-while on the south, it is terminated by Carlisle Tringe, and a welre-like block of noble houses formed bey the comvergmer siles of Westmore. lanl aml D'(lifer streets. A peculiar feature of I). is its spuares, whull are very mumerons, spacimus, and whll kept. Stephen's (irecon, the largest, ocouples an area of nearly 20 acres, and is ahont a mile in cireuit. somewhat smaller, lout anome elegant and aristocratic, is Merrion subare (I3 acms). The large park and squares of Trinity College occupy mone than 40 acres.

The pmblic lailinges of 1 ). are fommel for their muntur amb grambemr, ima apear to more whantaue since the dweblinghonses aro lmilt of lritk. In the dirst class may fre mentiomed the lank of Treland (furmaty the Homse of l'arlinment). 'Trinity Collewe, the fisiom-house, aml the Four 'uarts, which, from the ehasteness of then desion, and the massiveness of their projortions, have a very jmporinir - ffect. The casthe has no pretensioms to arelntere tural leauty: There are momunents to Willism 111., in Coblese firaen (onlee is !rren. lont now is buverd strect); of Kelsm, in Sackville Stanet; of the late Indie of Wellingtom, in thw Ihenix lork, with several othurs. The lemevolent and charatablu institutions of $I$ ) are sery mumerous, ans] are hbreally supportenl.

Within the limits of the Cirendar linand. the Lillivy is amoseel ly mine hriburs (two of inom), and ilursurghont the whale 'xtont of the city thir hanks of the river are faced with mande walls and garibnts. One netch sible of these 'dratse' thare is

 tho antity and fithy matgine of the 'I"hames. 'I'hor

 also in rommanmation with the linsal and framl

south walls, which have both deepencal the water, and rembered the harbour more safe. 'There is a bar at the month of the harbour, lut even there, the least depth at low tinle is abont 11 feet.

The chici wamufacture of 1 , is poplin. which is mucle celchratel. This, with sme glass-works, fomudries, distilleries, breweries, amb those workshops which are necessary to supply domestic wants, are the main brameles of inlustry. In this regari, T) is much more of a capital, and less of a mantifacturing and export city than Lomulon. People flock to I). to spemi moncy, not to make it; and the trame of the city and port is therefore very much rerndated by the wants of this gay jopulation. The elipect foregu trade, though increasing, is very limited, Glasgow, Liverpoul, and Bristol intercepting the grater portion of it. Mnch of the inland traftic is earried on by the canals above mentioned, and lay the ralways (now extembing to all parts of Treland, and cousists principally of articles of dairy and farm produce from the central comnties. The principal hanks are the liank of Ireland, the Royal, the National, Pruvincial, and libernian, with some priviute establishments.

The great edacational institution of D . is Trinity Collere and Cmiversity: See lhblin, CNiversity UF. In regaril to schools, I) is not well suppliterl. There is no pablic selumb such as the High Schonl of Eilinlurgh, but the elucation of the upher-aml midille elasses is left enturely to private enterprise. For the humbler classes, much has leten done by the National board (whose monlel schouls are attended by large numbers of childrens), by the c'hurch Eimeation Society, and othar agencies. There are miny literary and scientifice societies, dealing with subjects of general knowledge, or with matters ot local or uatiunal interest. There are two botanic garlins-ane at rlasnevin, belonging to the Royal Tublin Society, and one near Ilonnylbook, cullnected with the maversity.

The munteipal atfiais are mater the control of a towneonmeil, which consists of a lom mayor, I. alimmen, and 45 comncillors. The reveme which they darice from property and other sonrees varies from $\pm 0,000$ to $\pm 40,000$. There is a large police force. which luas charge of the city and of all the surromuling comotry as far as eight wiles from the eastle. The city sends two members to parlimment. The population of eity aml subuhs, in 1561 , was 29.961.

The environs of T). are especially beatiful. Lathmines, a southern submrb, has become a lateo township, and is the favomite residence of the wealthior part of the moreantile community filasnuvin, on the north, elesarves special notice as the fawourite resideluce of the poet Tickell, of deldison, Sturdr, Fambll, Swift, Sheriulan, aml many gther mathated men. In the remotery at fasnevin lie the remains of ('mram, ot'omeli, and 'Fom Steche. Tho l'lamix I'ark is a manificent areatof nearly ?OMA acres, jn somus parts level, in others with brakn ermand, haviner a larme amomet of timbur ame hrishomm, whede shelter immense horals of herr. It athoms ample sconse for military reviews, amb is mont extemsively usex by the inlablitants uf 10 , of all elasses fur recreatim. 11., as it whold. with its mamiment bay which has often been
 massiwe pulalie lablalues, whe she to, spations ami

## OUBNITZA-DUBOIS.

they are clected by competitive examination, and hold their sizarships (worth abont £. 77 per annum) for four years. Each rank has a dress peculiar to itself.

Entronco.-Students are admitted to the college after an examination over a prescribed course of classics, arithmetic and algelura, English history and composition, and modern geagraphy. The honour of first phtue at entrance examination is keenly contested ; and there are, hesites, I mizes of $£ 5$ and $£^{\circ} 2$ for excellence in special branches of the entrance course, and also for Hehrew.

Tutors.-Each student must at entrance place himself under one of the 18 junior fellows who are intors. These tutors stand to their pupils in loco parentis, and also have charge of their tuition, though each tutor does not necessarily teach his own pupils.

System. - To proced to the degree of A.B., $n$ student must keep terns fur four years, two terms at least being necessary in mach year. Terms may be kept cither hy residence, and attendance on lectures, or hy simply appearing on a stated day in the public hall, and passims a creditable examination over a prescribel course. Lectures are delivered on the rliferent subjects of each term examination by the tutors, the honour cxaminers, and the university professors; and prizes of the walue of $\pm 4$ and tel are awarded at the Dichaelmas examination to the first and the second honour men respectively. In the other terms (Hilary and Trimity), parchment cortificates reward the diligent. At the end of the fourth year, gold and silver medals are awarded to the senior and jumin moderators. Students of the first year are called junior freshmen; those of the second, semior freshmen; of the thirt, jomor sophisters; and of the fourth, senior sophisters. All students must pursue the following conrse: first pear, Latim, (rreek, mathematies; second year, Latin, Greek, mathematics, lugice, and metaphysies; third ? pern, Latin, direek, physics, logic, and metaphysics; finuth your, Latin, (ireek, physics (hoth mathematical and experimental), astronomy, and (ethics. For those who aspiare to honours, the course is much more extensive than that for mere pass.

Deques.-Term examinations having lwen duly passch, the student is promoted to the decree of A.B., which is conferred by the senate in full congrecation. The comitie for granting degrecs are hele three times in the year-on shmose linestay, the last Welnoshay in 'frinity term, and the last Wrinnstay in Michachnas term. Those stutents who, at the fimal ordcal of the fourth year, stand highest in an examination over an extra course in (1) mathematics and mathematical physies; (2) classies ; (:i) ethics and logics ; (4) experimental and natural science: (a) history, political scicnee, and Jnelish literature, are called (according to merit) seniur or jumior moterators. These form the first class of graduates, the second being called respondents. 'The third consists of 'unclassed candiclates.' The higher degrees are procurable after the lajse of is tixed mumbers of years, and on the performance of certan excreises, and the payment of fees.

Intinity, Matiod, and Enginating bichools:-Connoitell with Trinity "allage there are schools fur dwinity, morlabine, and enginerring. Graduates in
medicine and in enginecring must previously graduate in arts. The divinity testimomium is obtained after two years' attendance on lectures, with in examination at the end of each term.

Church P'atronuge.-The university has in its gift II valualle church livings, which are, in the first instance, offered to the fellows, should any wish to ahatuton a college for an ecclesiastical life.

Studentships.--In 1550, 14 studeutships were founded, worth $x 100$ a year cach, tenable for seven yeurs, to cncourage graduates in the pursuit of some special branch of study which they may afterwards be called on to teach, should they become fellows and lecturers. Two are given every year, and are aren to persons of all religious denomiantions. The provost and scmior fellows are the electors.

Goneral Remarts.-The university of Dublin is well equipped for carrying education to a high deyree of ${ }^{2}$ rffection. The teaching staff is mumerous, and in the actual work of tuition, the tatorial and professorial elements are more largely combined than in any other loritish university. Many distingrisher men have, in past generations, grone forth from her halls. The names of Ussuer and Berkcley; of Elringtom, Lloyd, Magee, Sir W. IIamilton, Romney, Rolimsom, Macenllagh, Archer Butler; and of Burke, 'heridan, Cuman, Swift, and Goldsmith, with a host of others celelrated in prolitics, in law, in science, and in literature, are sufficient to indieate the success which has attended her sons.

DUBNITZA, a town of European 'Turkey, in the prosince of Thmili, is situated on the banks of the Djerma, a tributary of the Stroma, in lat. $42^{\circ} 10^{\prime}$人̌., and longe $23^{\circ} 20^{\prime} \mathrm{E}$. It has extensive ironworks. which attimd employment to the mass of the inhahitants. Vines are grown in the vicinity. Iop. 6000 .

DU'BNO, a tuwn in the sonth-west of European Fussia, in the govermment of Vollymia, is situated on the left bank of a small fucder of the styr, in lat. $50^{2} 27^{\prime} \mathrm{N}$., and long. $25^{\circ} 45^{\prime} \mathrm{E}$. It is very irregnlarly built; its streets are marow and crooked, and destitute of parements and the houscs are almost entirely lailt of woom. The people trade chiefly in corn, flax, tobacco, fish, and cattle. A large fair is also held here at Whitsuntide. Pop. S000, of whom at sreat many are Jews.

DUBOIs, Gumbume, cardinal, was bom 6 th September 160t, at Brives-la-Gaillarde, in Auvergne, where his father was an ajothecary. At the age of twelve, he came to l'iris, and contered the collere of saint Michcl, as a hancstic of the principal. Here lre male such good nase of his opportunities for acquiring knowledge, that he was afterwarls selected as tutor to the son of a merchant named Mawoy, amd eralually rose till he hecame tutor to the young the de Chatres. Although of andy exterior, he contriverl, ly his mixture of wit and hypocrisy, to win the csteem of the buy's mother, whle he possessed the most mimited contidence of his pupid. partly through their common luse of letters, and partly lecanse the tom upon himself the odious othee of panker to his vicas. His public carcer commoneer atter the marriate of lis pupil, in 1692, with Dademoiselle 13hos, a natural but legitimatised dangliter of Lonis NIV: INe then received from that monarch for his survices in brincimer abont the matel, a gift of the ahluy of Nit Just, in Picarly. He was next attachool to the French ennassy at the court of bonlon, where le formed some important pulitiona conuctions. On lis retum, be became private sucredary to his ohl pupil ; and when the latter (wow luke of orleans) became rement in 1715, 1). Decame virtnally the nowt powerful man in Pranes. The ervat ane of his life was the famens treaty sinned at lat llaye, 14th lambary 1717, and

known as the trimb allumee, luetween Kinglamb, Holland, and France. 'Tlue impmrtance of this act lies in the cireunstance that it eflectually changed the forcign poliey of limace, in spite of the Fimels princes, in spite of the tralitions of lenis XlV ., in spite of the dislike of the fomstish king for the licgent, aml fimally, in spite of cardinal thereni himself, the Spanish minister. In reward for his brilliant dexterity, D. received the offore of Minister of Forcign Attars, and in 1720, on the solicitation of George l. of lingland, was apminted to the vacant archbishopric of Camlnay In 1721. he ohtaind the cardinal's hat, and in tha followines your hecame prime-minister of France, when his ant hanty semed unbonded. He died loth Angnst 172.3 , a victims to hard work and the wildest delmachery.

DUBO'VKA, a town of European Russia, in the government of Saratow is situated om the mastern slope of the Sarpa Hills, on the right lamk of the Yolga, in lat. about $49^{\circ}$ N., and lonco $44^{\circ} 45^{\prime \prime} \mathrm{L}$. It is a depot for goods branght from the northern provinces, which it forvards to katschalinskala, is town zout forty miles distant from 1., and sitnaterl on the Don. 'ihe prodnce is thence conveyed hy the Don to the sonthern provinces. 1. has some trade in wonl, oil, imm, and manufactured articks. 1'01) (1855) 10,000.

## DUCANGL See Dumasar.

DU'CAT, one of the most extensively usel names fur a coin, mostly of gold. Ducats were tirst coinal in the 10th c.in Sicily, and took their nane from the legread fount on those carly Sicilian pueces: Sit tibi, Christe, datus, quen the rasis, iste J montus whereters means duchy). Such coins were extensively issmed after the loth c. in Italy, especially at Vomice. Venice ducats were callen Zucchini. from Zocon, where the mint was sitnaterl. 'Ilue dineat was adopted in 1559 loy the mprerial dint of (tomany into the currency of the empire, and was afterwaris coined in the several ficmman states, and orer the whole of the north of the Dinropan continent, Russia included. Many of the ferman states have ceased to issue ducats. The incat varies in weight aml dineness: by far the most common, which is emrrent in Austria, linssia, Hamlnurg. \&c, weighs it troy grains, sterling value alomt as. th, The modern Italian ducat is of much less value. The Hold ducat of Tenice is valued at bis. In the (late) kingdem of the Two Sicilies, the ducat (ducato del regno) is a silver coin and money of accont, formins the unit of the curreney, being divited into 100 grani, in the island of sicily into lot hajocchi. There are few silver dncats, lowerer, in existence, the common coin being the pastra or clollar $=100$ grami. The ducat $=3$ s. $4 l$. sterling. There are various linds of the Spanish IJuctuo, generally translated dollar. The ducado de pata, on silver ducat, hard $=4$ s. $s t$.

DUCATO, Cape (anciently, Lencálís), a headland at the sonthern extremity of a momontory of Sauta Maura, one of the lomian Isfands, in lat. $85^{\circ} 34^{\prime}$ N., and long. $20^{\prime} 32^{\prime} \mathrm{L}$. Cape D. was in ancient times dreaded by mariners, and the nomern Gireck sallo still fears the strong curents and the tierce galus which he has to encomiter there. point on the western side of the Lenculion promomtory is called sumplo's Leup, as it was sumpered that here the poctess precifitated herself into the sea. It is a white broken clif, rising formenticularly from the water to the height of about 2000 fect. (in its sumnit stood a temple redicated to Apollo, the substructure of which still exists.

DUCHEsND, Axpré (in Latin, Andreas Chesunus, or Ibuchenins, or Quercetams), the tathro of Ereach history, was born at He-Bonchard, in the

ennsisted of an upright and transverse leant, either moralle or fixed, from which the chair was suspumbed by a rone or chain. The practice of ducking conmenced in the latter bart of the listh c., and prevailal generaily throughont the kingtom matil the first part of the 1Sth c., and in isolated cases, as we have seen, even into the 10 h century

For the facts of this article, as well as for the cuts, we are indebted to a parer hy Mr Dlewellym Jewitt in the Retiquary (published monthly at Derby).

DU'CKWEED (Lemma), a gimus of plants, referrocl by many betanists to the natural orler Areere, lat resarded by others as the type of a small natural miler, Leminceer, which emsists chiefly of floating pluts, mere flat green fronds, with roots hanging lansely in the water, and umisexual flowers-ilestithe of calyx and corolla-bursting through a mamhanous sintlie in their martin. The Lemmacren are distributey throughout all parts of the work. Several species of I , are British, and cover the surface of stagnant ponts with green rerretation. Thair fhwers and fronit are rarely to be seen, hat they spreat rapidly by new tromels balding from then maryins.

DECTILITY is that poperty of lomlies ley which they are capable of bing thawn ont in lemeth, while dinninisling in lreath, witlout fracture in setparatim of their parts. Ductility is pecoliarly noticealle in the case of metals. It is pussessed also by guns, ghes, resims, and some wther bulies, which, when suftened by water or heat, may be drawz intu threads. Clays, when moistenevl, hecome ductile. Motals are ductile, querally speaking, at any toml"rature. lut their ductility is mucho influcnced ly temprature: some-lrass, for example-are more mantle at ordinary temperatures than when hot. Metals are chactile nearly in the orlcer of their Mallealility (if.r.), the order of their ductility being as follows, beriming with the hinhest : gold, silver, Jiatmum, irom, coper, zime, tin, lead, nickel, palladium, catminnt. Gome, however, as ivm, are mone iactile than mallealle. Tha ductility of gold amo ghass is surprising: see article lnvisibilery for an acconnt of the finemess to which ender-gilt silver wire and flases tulues have hen drawn. The dhetility of glass at red lanat sumas to have no limit; at hinh temperatures, this hrittle sulantancu may be drawn into threals tince than any hair, and of the binheat Hexibility. Its Hexibility, inheed, acemor ing to somp incrases in prymortim to the timeness to which its theteads are drawas and it conceival to he possible that wr may yet cenvert glass into choths for wearing aprarel.

the wits, philosophers, aud men of fashion in ber day. Among her friemls and correspondents maly be mentioned D'Alembert. Voltaire, Presilent Henault, Montesquien, Marmontel, and Walpole. Hler evening-parties at her resillence in the liue St Dominigne were famous. They formed a rendezrous for all the votabilities of Paris, and were much relished ly distingusbed foreigners visiting the city. 1n 1753 , she became blind, and in the frollowing year chose as companion and realer a Foung lady, Mademoiselle de l'Espinasse, of whom, however, she became bory jealous, on account of the attentions paid to her ly the friempls of the marquise. $\operatorname{In} 1764$, the two ladies separated, Mademoisclle de l'Lipinasse earrying with her a large number of enthusiastic partisans, who deserter the saloon in the live St Dominique, at the head of whom was D'Alembint. The Marquise Du D. died $24 t h$ Scptember 1750. Her correspondence with D'Alcmhert, Presilent Hénault, Montesquieu, and the Duchesse du Maine was published in 1509; and in the following year appearel at London her eorrespandence with Horace Walple (written between 171is and 1780), to which were added her letters to Vnltaire.
Dudevant, Amintine Lecile Aurore, Mandies a French authress, who has attainel an extraordinary eblebrity umler the name of Geolige Sund. She was born at l'aris in 1804, and is descended by the father's sile from the famons Marshal de Saxe. Her mailen name was Dupin. After having receiven a strict conventual edueation ( $1817-1820$ ), she married M. Dudevant in 1822: but in the course of a few years, finding the lack of congeniality of sentiment intolerable, sle arranged a separation with her hnsband in 1831, and repaired to Paris, where at first she was haril pashed to secure a liveluhood. Her first literary effirts male their apparance in the Figaro. la conjuoction with her frienl and companion for the time, Jules Sandean, from whose name she formed her nom de plume, she wrote a romance, entitlal Rose et Bunche (1832), which only occasionally rises alme mediocrity, and gave no hint of the splendid ability first fully developed in Imbiena, publishecl in the same year. This rmance, in which a glowing luart, deeply wounded ly the pressure of social relations, gives vent to its fetings, excited consiberable interest. This was inereased to the utmost hy the succecling romances-I'nlontine (1532), Lélint (1s:a), Jurquis ( $15: 4$ ), Anlmi (1835), Leon Leoni ( $15: 525$ ), and Simon (1536). Furing the next two years, she pablishel a great variety of works, in which she shewal herself to be deeply influences by the are in which she was hving. In addition tri her prorely imarinative productions, Matame 11. fomm time to contribute miscedlaneous cssibys amb poltucal articles to the jomrnal entitled le I/rumbe, so long as it was elited by Lammenais. She was muth occupiod at this time with philosuphical and theological speculations, and their indunce maty be triacel in the spiridion (1839), and the oxtrimalinary piee of prose poetry, entitlad Less byet Cordes di" lathe (1silo). She cherished, moreover, repulican indels of the willest mature, which apheared comspicmonsly in the Compmyon dh Tour de Pronce (Islon) and ni P'akize. ller brilliant literary sucess having mow paced her in comfortable circmatames, she whtumed a legal divorce from her husham, sul thus secured pussession of a prition of the property which she hal brought to hum as hap dowry she now occupied herself with ther elluration wh her two chidren, and spent hew time, sumetinus: in l'aras, sumetmes at her estate in Hori, whor she haw passed her chihdhend, or in journeys intoswitarland ame Italy. A dispute with
the editors of the Rever Ars Dente Mombis, which, from 153:3 to 1841, hal regulanly publishal har worlis in chapiters before they andeared in a beparate:

 cectings in lion of an onth by cindethalal. Fing of the Lurghndians. in Eith. Lomis ]e Wenmanare was the lirst of the Freuch kings who permitte? litiguts to apreal tu ams. The practice was prominited by Hemry 11.. in consequence of a motel Muel which tink place in his presence hetreen his frimul, Francis de la ('lastamerie. and Cuy Chalot du lamar, in which the battio was slain. 'íle reyal colict, however, was tutally ineffectual, and the
pratice of pivate thelling has generally prevailed more extensively in France than in any ither emmery. Francis 1 . patronised it by declarine that a he conld be borne without satisfaction only ly a base-tom churl, and still mone hy the example which he set in challengimg lis own great rivil Charles V. Jn 1509, the parliment of l'aris declaned all persons who were either principals or scemils in thels to le reljels to the king. Jint its efforts wore mavailing; and it is said that during the first 15 years of llemry [Y., mo fewer than tonis yentlemen perished in this fonlish mamer. In 1609 , Thenry aldal to the existing lenalties, introducing uven pmishment ly death in extreme cases. But these regulations were fored upn him by popular feeling; he had himself marersion to the practice, aud when he gave permission to Crequi to tight Ion Philip of caver he atheal: If I were not the king, [ wald la jinu second. The consequence of this fecline was, that he readily granter parions to those who hai rimated the laws which he hat been forcent in enact, and these laws mot unnaturally prontued an effect the wery reverse of their ontensible object. Duelling acpuired the charm of what the French call 'furbithen frut,' and thus lecaue a firshimalne and favourite vice Jn the reinn of Lumis Xlll., the custom was so prevalent, that Lum flernert, the Enghish ambassathr. Wrote home to his conet that there was searely a frenchman worth haking on whon hail mot killien his man. It would not seem, buwerer, that it was from neglisence in enforcing the royal edicts that duellmes then reached to so alamines a leight; for it was during this reign that two buldem, the greatest duedhists of the day, the Count de Boutteville and the Marquis de Fewon, were tried anil Beheated fur fersisting to fight. In the commencement of the reing of Louis XIV.. Rucls with four or five a sile began to be fentht; and two wery sanminary afficirs of this description having taken plitee, in which several lersmas of the highest rank were slan, the Gins in termined to put an end to the practice. He follishlud an edict in 10 or. forbidding it under the ligghest fonalties, which. unlike most of his prenlecessors, he had the firmness to inllict; and this measure, together with a solemm amement which was entered into anomst the unbily themselves, led at that time to its alnust total alodition.
The had dues not secm to have existed in Englami in Angla-Saxon times, and was probably introduecal at the Conguest. In its judicial form, it was not entirely obsolete in the reign of Qucen Elizalueth ; and Sir Jlenry Spelman gives an accoment of a trial by battle, which teminated, howerer, withont actual combat, in the year 1571. Sice Batiel, Theme bey. Private duelling was common, however, both in Elizabeth's reign and in that of her successor, hy whon a severe statute arsinst it was enactet in Gcotland (1600c. 12). Jumg the Civil Wars, men's minis were too much weapind with questions of grave inportance to leave time for puestions of Stiguette, and the duel conserfucntly deelinal; but it beame execedin!ly prabne churing the dissolute. reign of charles 11 . Some attenpts were made t" sumpress it in the rign of Willian 111, both in Fhglam and Sontland, inh, in 1712, the subject was remmanded to the attention of parlianent in the Quebis sperh, Jout the bill which was brought in by the gownmone was thrown wht, and the praction
 the sword was nhandmed, the number of dends dimimishom, thomen it was then that their irrational Wharader may be sail to hame attaned its maximmm. The pintel was substitutal for the sword, and the
 clity ley the meation doed uf a comple of fills, whe
composed of bread and the other of puison-was inanguratecl. Since this periond, the practice has fallen into disrepute, by the gradual operation of puble pinion, and in this comitry it may probably lre now regarded as timally abolished. By the law of this conntry, the act of killintr in a dutel has always leen regarded as murder, however fair the had nay lave been; but whilst the practice was conntenanced by public ofinion, it was generally fomm impussible to induce a jury to convict. That a verdict of aequittal could not be looked for with the same security in the present day, is probably a pretty grom guarantee for the practice not again making its apparance cyen in exceptional instances. In France it still prevails to a certain extent.
The dals of the stulents at the German universitics, of which so much useal to be said and written in this country. Were nothimg more than fencingmatches with sharp weapons. They were foolish, bont nut dendly affairs, iss the seconds, who were also armed, always interfered to prevent serions bundshad.

In 184, several new Articles of War were issued by the cmmmader of the Forces, with a view to thie alatement of duelling in the army.

1. Every otheer who shall send a challenge, or who shall aecelt a challenge to fight a duel with another ufficer, or who, heing privy to an intention to timht a duel, shall not take active measures to prevent such duel, or who shall uphaid another for refusing or not giving a challenge, or who shall reject or alvise the rejection of a reasonable propositime mate frre the honemrable adjustment of a difference, shall be liable, if convicted before a general court-martial, to lee cashiered. or sutler such other punishment as the comrt may award.
2. In the event of an officer loeing brought to a court-martial for having acterl as a seemd in a duel, if it apperr that such officer exerteci himself strenuonsly th lring about an honomable arjustment of the difference, but failed throurh the mawillinguess of the aulverse parties, then such officer is to suffer such pumishment as the court shall award.
3. Approbation is expressed of the condnct of those who, having had the misfortune to give offence to, or injure or insult uthers, shall frankly explain, a pulugise, or otfer redress for the same, or who, hiwing received offence, shall cordially aceept frank explanations or apolugies for the same ; or, if such apolugies are refused to be mande or accepted, shall submit the matter to the commanding ofticer; and, lastly, all ufficers and soldiers are acquitted of disgrace ur disadvantage, who, being williug to make or acept such redress, refuse to accept challenges, as thay will only have acted as is suitable to the dhatacter of honourable mon, and have done their huty as good soldiers who sulbject themselves to disciphate
fratly in conseruence of these regulations, but still mire as a result of the increasing reason and lmmanity of Fingisl socicty, the practice of duelling has thecome almost as cintirely obsolete in the british army as it has in the conntry generally. See Othbiat.

differing very much from that of the whales, iolphins, and other ortinary cetaceans. It feeds on the algre which grow on summame rocks in shallow seas. Its lips are of monch use in gathering tomether its food. It often comes to the surface to herathe, and is said to utter a preculiar cry. It is grumanoms. The female produces one young one at a lirth, and shews an affection for it which is proverbial among the Malays. When the young one is taken, the mother is easily secured. The D. is demerally fursued in boats, ame killed hy spearing. The flesh is highly estemed even by Eurppeans, and is described as resembling young beef. That of fullgrown animals is, howcter. omparatively coarse, on which aconunt, and the greater facility of capture, the pomger ones are more frequently killem. Accorling to Riuppell, it was with the skin fif the 1 . of the hed sea that the Jews were directed to reil the talmacle.

DUGUAY TROUIN, Pifis, one of the most celebrated naval officers of Fravce, was lurn luth Jume llas. at St Malo, left the school at Caen, where he was to have studied thenlegy, with the reputation of a gool-for-mothing fellow, and betook himself to the sia. His career, which was very brilliant, may be diviled into two parts, the frost extending from 1659 t 11697 , and the second from 1697 to the close of his life. 1roring the formor, le cruised about as a sort of mivateer, intlicting immense hamace on the enemies of France. The English merchantmen suffered severely from his attacks. In the Chaunel. on the coasts of Ireland and Molland, in the Spanish Main. cverywhere fortune fullowed Dugnay. Louis XIV., as a reward for his daring explaits, admitted him into the state navy, and gave him the command of a frigate. The secomd piart of his carcer was as brilliant as the tirst. In 17: he engated a part of the budlish flect at the entrance of the Chamel. burnod ohe shin, captured three others, and about 60 transports; lut the most glorinus of his trimmplas was the attack and capture of lioo Janeiro in 1711. after hestilities had lated for eleren days. The city was ransomed for G10,000 cruzales. Tilee Sontly Anerican expention of 1). T., which cust lontural in all ahout $30,000,000$ francs, put the seal to the celebrity of the French commander. He was sucees. sively named def atestelto. member of the comucil of the lodies. lieutenant-qeneral, and naval conmandant at lirest. In F81. Lunis XV. sent 1). T. into the Levant to chastise the harkarians inhalitine the neichburing enasts, and to whan repasation for the damages done to French commerce. In this alsn 1). T. was successful. He died 2.7 th ingimuler $1-36$. His Mómoires were pablished by beauchamps (l vols, Paris, 1 : 41 ).

DUEIDA, a momatain of Venezucla, in Simth America, stands in lat. :30 $30^{\prime} \mathrm{N}$., and long bio $10^{\circ}$ W. It is of conspicums form, being perpembicular on two sides, and lare at the smmat. Risins. merenser, to the hight of sant feet, it forms a safe lamlmark for the byyaser on the Orinoco.

DI'ISBURG, a town of thenish Vrnssia, abont I5 mides nerth of Disseldorf, is situatod in a fortile district, lortween the liuhr and the linine, which unite about three miles below this town. It is surrmmond fartly by wallo, thanked with towers, Wholl are mow smowhat dowayed, and partly by a ranfurt and ditches. I) contans a gymasimu
 charehere foro of which that of st Joha the liapt ist, dating fomm 1157 , amblist salvalu's, a hambonme spestmen of the arditworn of the 15th c-are worthy of motio. 'The mamfactores of 11. comsist chandy of cotem cloths, hasiery yhe soip, stam, ame loather there is also a large trate in wine amd
colmial proluce, grain, and cattle. In the neighhourlumi are ironworks. Popr. 11,629. D. is an ancient town. In the 13the., it was a member of the Ilanseatic League, and afterwards a free town of the German empire, hut at the close of the war in IS15 it was handed over to l'russia.

DUKE (Fr. duc. Lat. dux, from durere, to lead). a term aplicd originally to any military leader: Gihbon infurms us that the title came first into use when constantine separated the civil and the military commands in the provinces, which had been exercisued in common ly such men as Agricola. Frum that time forth, the military governars of prorinces were either comnts or dukes. But these titles originally stond to each other in an opposite relation to that which they afterwarls assumed. 'It should be recollected,' says Gilbom (iii. 57, cap. $x$ vii.), 'that the second of these aprellations-that of duke-is only a corruption of the Latin worl, which was indiscriminately applied to any military ehief. All provincial generals were therefore dukes, hat no more than ten among them were dirnified with the rank of counts, or companions, a title of honour, or rather of fatour, which had been recently invented in the court of Constantine.' Sce Count. 'A gold helt,' continues Gilhnon. 'was the ensign which distinmished the office of the counts and dukes; and, besides their 1ay, they received a liberal allowance, sufficient to maintain 190 servants and 158 horses. They were strictly prohilnted from interfering in any matter which related to the administration of justice or the reveme; and the command which they exercised over the troops of their department, was indelendent of the authority of the magistrates.' When the Guths, and Franks, and other larbarians successfinly invaded the provinces of the empire, they preserved the titles of count and lake, if they had not already borrowed them from the limmans. But amungst races who owed their supromacy to the swond, no dignity could prevail over that of the commanter of an army; and the dukes, as mulitary chiefs, acynired a marked pre-enirence over the counts, whise lofty functions under the empire had been partly of a civil, and partly of a military uature. The unly exception mender the first Mowngiaus was in the case of the Count of the Palace. Sue const. In the hierarehy observed by the Franks and other Tentouic races, the ordiwary count became the hentmant of the duke, and the gavermment of the latter extended to several provinces: whereas that of the former was confined to one province, or even to a simgle locality. The bwer of the dukes \&rew so rapilly, in conseguence of the dissensims of the Merotingians, that. towards the eml of the sixth c. (552), they arrogated to thomselves the right to dispuse of the crown. Amonst the canses which timuled to raise the l"wer uf the dukes, was the immense wealeh which had leon aequired hy the great provincial Eanilies. The chiefs who had attached themselves to the fortuncs of 'lasis hatd been richly endowed with compured lands. After the clese of the 7th e., they overshalowel the crown, and the title of prince and chicf (whif) heran to be attributed to them. It has leen sad that the ducs-metres of the palace sometimes assumal the tithe of Archanke (q. vo). Thedre the semml dyasty, the title of luke retained all its diymty and importance, and it was to the sucerssive invasions of local non central 1 wwer, that fomahty usw its urigin. The concession, tacit or "xpmess, of hwoditary power and independent jurishiction, lirst to the central province known as the 1sla of France, ami then to Aynitane, extembed Itsilf, mular the 'arlowingians, to Burgudy, Normanly, and fiasomy : ant in the accession of Ilugo Canct, to all the other subaltern temures. ## dumbeness. Sce Deaf and Durb.

DU'MIOUM, the name of a town and of a valley in lndia-1. The town is well known in the military history of the country, stamling in lat. o2 $2^{\circ}$; N., and long. $58^{\circ} 30^{\circ} \mathrm{E}$. It is ten miles to the somth-east of barrarkpore, and eight to the urrth-east of Calcutta, having extensive accommoklations for troops, and a cannon-foumiry. The place is famous in ernnection with the mutiny of 1507, as the scene of the lirst open manifestation on the part of the sepoys against the greased cartmiges. - - The valley leals into Cashmere from the smith, wer what is called the Pir l'anjal Pass, whose crest is 11.500 feet alove the level of the sea. It is ahout lat. $33^{\circ} 45^{\prime} \mathrm{N}$., and long. $75^{\circ} \mathrm{E}$.

DUTIFRIES, a royal. parliamentary, and municipal hargh, river-pit, and connty-town of Dumfricsslive, on the left bank of the Nith, nine miles from its mouth in the Solway Firth, 73 miles sonth-ly-west of Edinhorsh, and 33 west-northwest of Carlisle. It stands on a risingegroum, surmandm, except towards the sea, by heme manlating hulls, many of which are green to the tol. It is an irrognla but well-built town of red freestome, and is reckoned the capial of the south of Scotiaml. Two hridres cross the Nith to Maxwelltuwn, a suburb in Kirkendbright. One of the bridges is psually stated to have been bernu by the mother of John baliol, king of scotland: but is in reality a stracture of the 17th c ; it had 13 arches, with a central mate: only six arches now remain, and it is limited to fout-passengers. Inigo Junes erecteri the mid-steplle of the town-buse. The very hich tides of the Solway Firth hring ressels of sixty tons up to the town, and larger ones to the river guays lelow the town. D. has twor lage manufactories of women choths (Twemds); it also manufactures hats, hosiery, luather, baskets, and woulen slres. The chaf exports are woullen cloths, wow, freestone, hosiery, shes, sheep, grain, womi, and hark. 1) is noted for its markets, livestack being here transferrel from Seoteh to Enchish dealers. Iop (i561) 14.1024. It minites with Anman, Simpuar, Luchmalun, and Kirkendbright, in scuding matember to parliment. D. arose in a castle, of which mothing now remains. The early Sontch and English kings had frepuent contests for ita punsession. Abrut 1200 , a monastery was fommal here, in the chaprel of which Comyn (q.v.) was stabisel lyy Lidurt Brace in 1:305. The town was often plundered and hurued in the border wars. The Murhandors, under Prince Charless in 1745, tinad 1). $t+400$, and phumbered and burnet it, Bums was for sime years in excisman here, and lis tumb is one of the motalu whjects of the phace. ln 1stob, 1:312 vessels, of 7a,3to tons, entered and cleare the port.  The mineral prohnets are conal, limestome, wath, irmstone, lat, and siker. There are extmone lond-mines at Wanlockhand, two miles from Land. hills, in Lanarkshire. (thl was tomerly alitamud in fuartz veins in the hulls near Wialnokhath: a mass of dive ounces foum there iv now in the Liratioh Musenm. There are noted sulphurnoms spinge at Doffat, and chalyheate umes at Hart Firll. 'ilho climate is moist and mild, and mest of the hamb has a sonthern expmare. The sont in the lower parts is a light, pravelly, or samly loma, or clay. There are rich alluvial tracts ahon the rivers and on the solway Firth. The Lachar part tract, on the Solway Firtls, is 10 by 2 to $: 3$ miles, and coms. tains shells, trees, and fruments of ships. The chicf oecupations are agriculture and the rearine of eattle, sheep, and pigs. In IS.7. nearly a fometh of the comenty was in crop, the pincipal crops being vats and turnips. Sheep-farms wechy the hills, of which a third of the connty consists. The chave exprert are cattle, sheep, grain, frcestone, worl, hams, and hamm. There are fisheries of salmon in the rivers. and of conl, cockles, and mussels in the solway fiath. Two railways cross the cumbty from (arlisk to Edinhurgh ame Glasgow. I'op in 1sel, 75, 7. In 1551, 1). han 78,123 inhabitants: 176 sclunhs. with 11,349 schulars; 92 churches (:i6 beiners Eistah. lished, 20 Free, and 20 United I'reshyteman). The chief towns are Dumfrite, Aman, Bompalar, Lochmalen, and Dloffat. D. sembls me member to parliament. A thard of the comaty belones to the Duke of Buchlench. There are mimerems antiquities. 1) formed jart of Valenta in loman times, It afterwards belonged to the Sionu Northmman kings. (1871- [mp. $7,508$. )

DUMMOW', a town in the territory of Samor and Nerbmedda, stanls in lat. $23^{\circ}$.iN N., and hing $79^{\circ} 30^{\prime}$ E, becing 755 miles to the westward of Calentta. It has a laque bozar. and is almmantly provided with wells. Its district, a pergumah of the sime name, contains $1,554,055$ acres, and 363,554 inhabitants.

Dundont, Pierie Etienve Loule, an able proparator of the Benthamite phanomphy, was lom at Geneva, 18th July 17.99, stuhted thanhy, and after otficiating as a minister for a shont time in lis native town, procectal to st I cetershurg in 1783, where he aceejted the charge of the Frowh Protestant Church. In 1755, he lift Linssia, went to Eugland, and became tutor to the sons of Lord Shellurne, afterwards Maryuis of Lanalowne. His superior talents, hberal sentments. and tine character, soon recommended hum to the illustrous Whigs of that periold with Sir Sanncl Comilly, in particnar, he formed a chase frieniship. Dhine the early years of the Fremel lievolution, D. was at Paris, where be became greatly attached to Miraluan, regarding whom he has given the worh much important information in his somermers sur Mirabean et sur lesdene Premiores Assemblers Lénislatives (which were not phished till 1532 , seven years after the anthor's death). From this work, it appears that D. wrote many of the hest articles ami speeches attribnted to Nirahman. In 1791. I. roturned to England, and formed an intimacy with lenthan. 'J'has was certainly the most impertant event in his hafe. Decoly convonced of the value of that philusopher's mews of legislatun, he rempented his friend to allow him to arrange and ehit his

DUNBAR, Whlmm, the greatest of the am Souttish prets. is supposen to hawe been borm abont 1460. In $14 \pi$, he went to Nit Andrews where, in 145, he took the degree of loA. and in 145! that of M. A. Consilemble olscurity rests upon his carcer fur almut twenty years after be left the misersity. From his own writincs, we learn that he enterd the owh of St Francis, and was employent for some time as an itincrant or preaching friar. In that carraity. he ascended the pulphit at Itraton and Canterbury, and crossed the sea at fover, and instrmeted tix inhabitants of licarcly: He apmears to have enteral the king's serviee, and to have been retaned as 'elerk' or secretary to some of James's muncrons embassies to foreign conrts. In $150 \%$, he whained from the king is vearly pension of £10. In In\#l, he visited Fuglanel, in the traiu, as his himpaphers suppose, of the amlassathors sent thither to eonclude the negotiatims for the king's marriage. On the 9th May lints, three month lefore the queen's arrival, he comporel in lomomr of the event his most famous Inrem, the Thrissil umt the Rois. He seems now to have livel chictly alont court, writing poems, and sustaming himself with hone of preferment in the church. On the 17 th Marel 1504, he received a gitt for saying mass for the first time in the royal mesence. At Nartimmas 1507, his pension wat donlled, and three years afterwards, it again receivel augmentation. "He is supposed to have visited the northern parts of Scotland in May 1511, in the train of Gueen Nargaret. After the ruinous Ilcfeat at Flodilen, aml the confusion eonsequent on the king's death ani a prolonged regeney, D.'s name disaprears altogether. He is surposed to have died ahont 1520.

As a poet. he possessel a wonderful variety of gifts; his genins eomprised the excellences of many masters. He is at times as rich in fancy and colbur as spenser in the Frery guen: as homely, and shrewl, and coarse as Chancer in the Miller's Tole: as pions and devotional as Cowner in his Ilymins; aml as willly grotesghe in satire as Burns in his Heath oud Dhofor Hornboms. When Soatt read Iurtions of his works to Crahke, in Elimburgh, the latter remarked that, "hefore the Ayrshire phorghnan, Scothand possessed at least one great pnot? A cmmpete amd carefully elalurated edition of O.s Womks, ly Mr Davil Laing, was published at Eidinturgh in 1504.

Vessels drawing 16 feet can enter the hartome, 1). has manufictures of tolacco, soap, leather, pins, starch, amb salt: steam llour-mills: important fistheries: distilleries, and Hax-sluming-mills. The chief expmots, especially to Liverpond, are timber, coal, irnn. slates, flas, linen, ani all sorts of ayricultural aul dairy prolucts and biestock. I) is the chnef matlet for the produce of the connties of Louth. Dlomayhan, and Cavan. Pop. ( 1561 ) 10,1 IV. It sends oue member to parliament. It has the remains of a Franciscan friary and a Druid's circle. The last king of all lreland was crowned and resided here. Elward Brace took D. in 1315, and crowned himself and held his court here till killed in hattle by the English in the vicinity in 131s. 1) was captured 1,y the Trish in 1641 , by tormwell in 1649, and by Schombery in 1659.-Dexphlk Bay is a shallow inlet of the Irish Sea, in the cast of Lonth connty, cight miles lowally seven decl, and with fome th six fathoms water in the miduc., It contains oyster buds, and receives the rivers Fane. Dee, imb Cistletom. In 1560,1167 vessels, of 932,923 tons, entered and cleared the port.

DUNDAS, a term of various mplication, indicates a castle and manor, a town, an island, a grould, a river, and a strait.- 1 . The castle and manor, from which all the others take name, are on the south bank of the Firth of Forth, near somuth ? Puensferry; the castle is a synare tower of the loth $c$., with modern additions; the manor was the oricinal seat of the distinguished family of Imodas, to whuse proremtor it was urantel by the Earl of March about the year 1150.-2. The town is in Tpmer or West Canada, bemr at the head of Burlington Bay, at the western extremity of Lake Outario- - The islaul, which belongs to Great Britain, is situated on the north-west coast of America, 40 miles north-east of Queen Charlutte Islam. It has Dixon's Entrance (4. v.) on the west, and is seyarated by Chathan sound from the most southerly of the Russian ishanls. - 4. The group lies off the east coast of Africa, hemp about liat. $1^{\circ} \mathrm{S}$. It comprises nearly 500 islets, all of comal. line formation. There is only one secure harthur. - 5 . The river is a tributary of Melago liay (i.v.). -6. The strait, in North Anstralia, separatus Melville Island from Coburg Peninsulit, being 18 miles aeross.

DINDAS (of Aruiston), the uame of a Senttish family singularly distinguished for learal and $1^{\text {molitical }}$ tabut. Sir James Dundas, the first of Arniston, recrived the honour of knighthood from Jimes VI, and was gnwernor of Berwick. Jis som, rib Janes Ihmelas, was apminted a judge of the lourt of kission in 1662. and took his seat on the bench under the title of Lard Armiston, hut was semo aftor deprived of lis othe for refusing to abjure tha "Natiomal and Sulemm League and Coremant.' Ite dimd in 1679 . His eldest son, Sir Romere Dumbis, who alsurose to the bench, died in 1727.-IDumas, homerat, the son of the preceding, was bom !th hecomber 168.5; hecame a member' of the Faculty of Adrocates in 1709 ; and in 1717 was appuinteil Sulicitor-seneral for Sioutland, an office which ho filled with great ability in a perime of unch political confusion. In 1720 be was made Lomb dilvocate; and in 1722 was chosen to repmesent tho comaty of Einhburg in the Britisls parlament, where he homonally distingnished himsolf by his attention to Bonttioh allairs. When Sir Tonkry Wralpole cane
 wationtem Inear of the Faculty of Alpocates. In 17:h7, $1_{1+}$ was raiswl to the bumb, when, like his fatlore ame grandfathor, he tomk the title of laril Amiston. Un the death of Lard I'resident Formes
of Culloden, in 1745 , he was alminted his successor. He died in 1753. As an adrocate, D . was a powerful and ingenions reasoner, and thongh somewhat disliked on the bench, his ability was nniversally admitted.-Dundas, Hobert, the eldest son of the preceding, was born 1sth July 1713, studied at Edjuburgh and C'trecht, was almitted to the scottish Lar in 1738, and rose to be Lord Advocate (1754) and l'resident of the Court of Session (1760). D. died at Edinlurgh, 13th December 1757.

DUNDAS, the Hight Honourable Henry, Viscount Melville, and Daroy Dunira, hrother of the preceding. was boru in 1741, and educated at the university of Edinburgh. He was admitted a member of the Scottish bar in 1763. As a younger son of a pretty numerons family, his circumstances were ratber straitenct ; hut his assiduity, his large share of the family talent, and no doubt of the family influence, sonn procured him adrancement. in his profession. He was successively appointed Depute-alsocate and Solicitor-general. 1n 1774. lee was returned to barliament for the county of Elinhmorb, and in the following year was appointed Lord Advocate for scotland. Two years after, he was made keeper of the King's Signet for Scotland. D's career in parliament was bighly successful, though not very crelltable to lis political consistency. Elected in oppsitiou to ministerial influence, he soon alljed Limselt with the party in jower, and became a strenuous supporter of Lord North's administration, being one of the most obstinate defenders of the war with the American colonists. When Lord North resirncil in 1781, D. continned to Luld the office of Lord Adrocate under the Siockingham ministry: On the question of the war with America, 1). hand been olloused to litt; but when the Coalition Dlimistry was formed by Fox and Lurd Nurth, he passed over to the side of his old opionent, and became Titt's ablest coadjutor. When I'itt returned to the belm of the state in 1784,10 , was inppointed President of the Board of Control. In 17st he introduced a bill for restoring the estates in Scotland forfeited on account of the reloelion of 1740. In 1791, he was appointel principal Secretary of State for the Home Department. He also held a great number of otber ollices. one of which, the treasurarship of the navy, involved him some years after in much tronble. D.'s aptitude for husiness was undeniakle. Many of the most important public measures originated with, or were directly promoted ly him. Among such were the formitim of the foncible regiments, the supplementary militia, the volunteer corps, and the provisional cavaly'y; in sloort, the whole of that domestic military force raised during the war consenuent on the Fromeh Revolution. When litt resignal in 1sol, D. Cill the same. In 1sin, under the amminstration of Mr Adhington, he was elevated to the pectare ly the titles of Viseount Melville and barom Lmara. In 1805, his lorlship was accused of 'gross malver. Satton and brewb of duty.' while aetina as treasmere of the navy. The trial commented enth A A mil Ismis: but in spite of the sphmid array of Whig talent awainst him, D. was acupuited on all the eharous. After this, lumeser, he tomk litale part in publie affirs, spouling the most of his time in retirement in Senthanl. He dical at Edinhorgh, 27 th May 1811.

DITNDEF (hat. Tuodumum, the "hill or font on the Tay"), a royal parliamentary and manicipal hurgh and scaport, in the suath of Forfarshire, on the left hamk of the estuary of the 'lay, here two miles lowad, 10 males from the contrane of that river

 Forfar. In derpation, it is the third town in seotiand.

 tricos of ancient vatritication) and Balkay [hll and the Tay. The new streets arr wide and well latd out. The most striking architoctural features of the town are-the Town llall, in the loman lonic styln, with a sprue 1100 fout hish, arceterl by the - Bhlar Adans,' in 173.f ; the Albert listitute and Five Library, in 15th-contury Conthic, from alcsims hy Nir dilbert Sentt, recently ereeted at a cost uf 2:30,000; the liond Exchange, built in the Flemish pmintel style of the 15 h c ., at a cost of upwards of
 Honse; the Com Wxchange, capable of containinis Don people; the lntirmary; the dnsticiary and Sheriff Court Buidines; the Post-uflem; the llinh Scheol; the Town's (lhmelhes, with the bhl tower, 151 feet hich, just restorcel (157is) under the charze of Sir Gilbert Scott, at a cost of touns, st l'aul's Episeopal Chureh, with a tower and spire 297 feet high; St Paul's Free 'lhurch, with a tower and spire 167 feet high; and st Enoll's Free Chured, with two handsome Lowers; the Morgan Ituspital (openem Isis), erected and milowed at a const of nearly fro, 100 , under the will of John Morgan, a native of Ibumee, for the maintemance and clucation of 100 boys; and the new Orphan Hospital. D. has scteral public parks, one of which, the Baxter I'ark, on it beantiful slope to the castwarl of the thwn, is : $: 7$ acres in extent, and was presenten by the late Sir David Baxter, at a cost of $£ 50,010$; auther, to the westward of the fown, ocupies the hill of Balgay, and is tinely wooded and heantifully laid ont, its extent being abont 60 acres. 1). is the chief seat in Great Britan of the manufacture of coarse linen fabrics (Osmaburus, flucetinus, ducks, dowlas, drills, canvas, and cortace. Mannfactures of jute are almost exclusively carried on hare. The consumption in 1) of this material. which is grown in India, amounts to fully 180,010 tons anmally. The raw material costs in 10. a little over $\quad d$, per 1 lb ; and the cloth male from it, reckonal by woinht, is the cheapest textile fabric made in Great hritain. Of jute many varieties of falmic are madr. from the crarsest nail-barging to carpets of grat leanty. This range inchates packsheets for every species of merehamise. sades tur wowl, coffee, guanu, \&e. The annmal value of the thax, hemp, aud jute manafactures in I), is upwards
 ture of confectionary, which is expurted to all parts of the work. One tim uses lint tims of bitter oranges annmally in the manafacture of marmalade. ship-building (both wom and irm) and machinemaking are carrice on to some extent. D. las magnificent barlours, in adhtion to the tide harlour. Its wet rocks cover 35 acres, we of them admitting vess ls drawing, at spring-tides, o5 foct; and at neap-tides, $1!9$ feet. The dinks have heen erected at a cost of mpwarls of $\pm 6010,0$ on ; and plans for extenting them gralnally, so as to inclode an area of 122 acres, are under consideration. In $159 \%$, $25-18$ vessels, of 421,255 tuns, entered and cleared the port. At the north end of the mid guay stands the loyal Arch, in commemoration of Her Majesty's landing here in 1st. Shmele is at prescont well suppliel with water from Monikic, 10 miles ristant; and an act has been olstainel to brine in a vely abuntant surply from the Loch of Lintlathen, abonit 24 miles distant. Pop, (1871) 118.977. I) sents two members to parliament. It was an impmentant bace in the IOth century. Edward I. was bere in $120 \%$ and 1303. DUNKELD, a city and lurgh of hamsy in the fast of Perthshire, 15 miles north-month-west of Perth. It lies in a deep romantic hollurs. on the preat. east pass (of Lirmarm) to the Highlands, on the left bank of the Tay, across which it commmicates with the sonth by a handsme bridge, lmilt in 1809 ly the Duke of Athole. It is envirmen hy tarkwooded and craggy mountains. Pop (18G1) 920. D. is a place of sreat antiquity, dating probably from the 7th or Sth century. About the year 1130, King Datid I. made it the seat of a bishopric, of which the C'uldees of the ancient abbey were the chapter The choir of the eathedral, chiefly in the First Pointed style, was built hetween 131S and 1337; the nave, in the Secoml loonted style, was luilt letween 1406 and 1464 ; ane the tower and chapterhouse, alsw in the Seamd Pointed style, were Imilt hetween 1470 and $147 \%$. The choir is now the parish church. The nave, which is in ruins, contains one or two ancient monuments. The monument of the Wulf of Badenoch (Alexander Stuart, Larl of l'uchan, who died in 1354) lies in the vestiInle. The Duke of Athole's gromarls, unsuriassed in Scotland for extent and beanty, lie on the west and morth of $D$, and include the cathelral: Craigvinean and Craisy-Barns; 50 miles of walks, and :0 miles of drives; falls of the Bran (apper one, So fect), wear Ossian's Hall at the Rumbling Bridge; and 20 square miles of latch-wood, inclunting the first two larches planted in Britain (in 1737). I., in ancient times, is said to have been the seat of the lictish kings. It was the seat of a diocese from 1127 to 1658 . Three mikes sonth of D. stood Birnam Wired, so famons in connection with the fate of Iacheth.
DUNKIlRK, on DTXKEAQUE, the most northcrly seaport and fortitied town of Franee, stands on the eastem shore of the strait of lhower, in the department of Nord, its distance from l'aris lejng in a direct line aloont las miles north, and from Lille about 43 miles north-west. The town, which is connected ly railway and canal with the principal manufacturing centres of Belvinm and liance, is surromaded by ramparts and ditches, and is defended hy a citadel. It is well built, the strects pacions and well prach, the hanses chietly of brick. Its quay and pier, its church of it Elai-ar Gothic structure, having a landsome though rather incongruous frontisplece in its Corinthian protion -its town-hall, harracks, college, and thontre, are the principal arehituctural fatures. The hatmur of D . is shallow, and the antrance allicult, lat the roadstom is larero and safle. It. hats mame factures of soap, starch, heer, heotront-surar, combaree, and leather; alsu motal foumlries, distillerins, salt-refineries, and ship-habling yarls. Fommes as it dues the outhet for the eneat mandacturing dequrtmont of Nord, its trade lay sea is very comsuldable. Kince beenmine a free funt, it has alsa curied on a prod trale in wine and lanueurs. Its con amd horing tishmies are actively pmanatal. The immoliats vicinity of IN has a theary aml

I. is a phan of consilurable historio interest. It nwes its mosin, it is saisl, to the chureh built he St Elni in the 7th ".. in thr midet of a waste of
 of the Dhnos.' W. was bumed by the English in

1658, but sold to Lonis XIV. by Charles II. for a sum of money in 1662. Wy the treaty of Utrecht in 1715, the French were compelled to destroy the fortincations of D., which were acain restorerl, however, in 1753. In 1793, the allies under the Duke of York laid siege to D., but were compelled by the French to retire, after having sutfered severely. D. was made a free port in 15213 .

DU'NLIN. or IURRE (Tringa alpina, T', cinclus, or $T$. veriatilis), a hird of the family Scolopacido (Snipes, \&c.), and of the large group to which the names Sandfiner and stint are variously given. It is not guite nine inches in length from the extremity of the bill to that of the tail. The plumage undergoes great variations in summer and winter. It is a

Dunlin (Trinua apina): Eummer and winter plumage.
rery widly diffused lided. In summer, it frequents even the desulate shmes of Melville Island. It is to bee seen in autumn and winter on the shores of Britain amd of most parts of Europe; often in yery great mumbers on sandy or muldy sea-shores; and is equally common on those of Amprica from the Gmif of st Lawrence to the Rinlf of Mexico. It exhilits , wreat restlossmess anl activity in ruming ahnot, searching and prolines for its food. "When tying in great autumual hocks, its aierial movements are extremely heantiful, each indivitual of the vast assemblage yielding su instantaneonsly to the same impulsion as to exhibit alternately the upper and the under surface of the londy, so that we have for a time a living moving cloul of dusky frown. and then a brilliant theh of smow whitrmess."

DUNOIS, Jear, called the Bastard of ombans, Connt of Dumois and Longueville, ome of the mant Inilitiant soldhers that France ever proluced, was lorn about the year 1403. Jfe was the matural son of Louis Dake of Orleans, brother of Charles Vf., and was brought up' in the house of that prinee along with bis logitimate chilhen. D. is sail to have lecen intendet for thio chmeh, lont this is doubted. His first important military achievement was the overthrow of the limelish at Dtomtargis (1-427). He next therw himself into Orleans with a small body of men, and bravely defended the place till the arrival of the fimmus Juan of Are, whose religinus enthusiasm eombined with the valmu of the Bastard raised the drooping spirits of the Freneh, and the linglish ware olliged to raise the siege. This was the tuming-point in the fortunes of the french nation. In 1429, J. and the Mail of Orleans won the battle of Patay, after which he marched, with a small body of men. through the provinees then ovemun ly the Enarlish, and took the fortified towns. The eapture and death of Joan of Are arrested for a moment the progress of the French arms, lat the heroism of 11 . was irresistille. He took C"hartres, the key of Paris, foreed Pedford to raise the siege of 1 agnv, chased the encmy from Paris, and within a very short perion deprived them of all their French conduests except Normandy aut Gbieme 'The next grand series of suecesses on the part of $\mathbf{J}$. was the expulsion of the English
from Nomandy: Town after townyielided-Lonen, Tartlem, Thontlonr, Cam, F゙alaise, Cherhourg. This splembld canmaign listed only in year ant six lays. Dot less trimmphant was his varect immelintuly after in Guinme; Montguyon, Tilaye, Fransite, Jum-
 Eninlish, in filet, ware swept mit of the ownotrys and the freedom of France from all extermi] [imesatue permanently secured. Lanis XI., on lis aceresmon
 Geman, which had yichlad itself to franme, but somm after, in a dit of jualonsy mml susprom, deprivert him of all his wheres. II. now placed himself at the

 cotates. Jie lied "tth Nurembrr 146S. There is no anme su puralar in France as that of 1). there is no hom so mational ; he lahomed as yoars for the deliverance of his twontry, and this alour-his sword was never mashoatherl, exeept against the Einglish. the never had a fome under him which cruad cnable him to win a victory that might halane A sineomrt or Créer, but the multitule ame eonstancy of bis petty successes served the canse of lirance more rffectively than great and sangumary contests would have done.

DONOON, Oמ口 of the most frepuented senbathing fletees and snmmer resilemees in the west of sootlaml. is situaterl in the smotb-cast of Argyeshire, on the west side of the Pirth of Clyde, nime milus west of treenuck. ## DUPIN-DUPUYTREN.

de 1830, he endeawourel to prove the legal character of this revolution; and on the question beins mooted whether the new king should assume the title of Philippe VII., D. declared 'that the Duke of Orteans was ealled to the throne not bectruse be was a Bombon, but atthough hee was a Bonbon, and on the comdition that he should not follow in the footsteps of his predecessors.' After having been appointed to various important olfices by the new goverument, 1 . found it necessary to pass over to the opposition, and was eight times chosen president of the Chamber of Deputics. On the revolution of 1845, he urged (but nosuccessfully) the Chamber to prochaim the Comte de l'aris king uf the French, with the Duchess of Orleans regent during his minority. In consequence of the contiscation of the Orleans estates in 1852, 1 ). resigned his place, and retired for a time from jublic life: Lut in 18.57 he consentel to resume his previons affice of Procurenr-Géncol of the Court of Cassation. He bas written many important works, mostly on legal questions, minnes which may be mentioned his Mirnuel du. Droit Ecclésictstique Ficutctis, which had the high honour of being censuren loy the congregatinn of the Index at Tome. In 155.) appeared bis Le Horvan; Topogrophie, Ayriculture, Mours des Mubitonts, Etat Ancirn. Litat Actucl; and in 1557. Regles Generales de Droit et de Murale tives de l'Ecriture sainte.

DUPln, François-Pierre-Charles, Baion, a French economist, brother to the preceding, was borm at Varzy, in the clepartment of Nierre, 6th Octoler 1754, and eineated at the Polytechnic School, Paris. During the Empire, he was actively employed as an corgineer. Between 1816-1819, he made sereral visits tu England and Treland, to stady the great works of constraction in those countries. The results of his investications appeared in his Voyages dans la Grante Dretagne ( 6 vols., Paris, 1820-1824, with athas)-a comprehensive statement of the advantages and refects of British internal amminstration, exhibiting in a popular form a complete view of the roads, canals, aqueducts, bridges, ports, \&e., of this comitry. IU. was about this time apminted member of the Acalénie des Sciences, and in 1824 was raised to the rank of baron. In 1sos, he was electerl deputy for the department of Tam, and he took part with, the liberal opposition. Aiter the February revolution of $1545, \mathbf{D}$. was elected member of the Constituent Assumbly by the department of Seine-Inferienre. After the coup d'etat, he became a senator of the Empire. D. has published a multitule of works on gemetry, naval affains, chmmerce, \&e.

silenced the tumult of the populace, as to render it possible to appoint a provisional government, of which he was proclaimed president. He died in 185. His political friends styled him the most virthous among the virtuous, the Aristides of French lijeralism. IIs disinterestedness was not denied even by his enemies; but he manifested fidelity to his convictions rather than energy of character.
dupuis, Charles Frasçols, a distinguished French sozunt, was the son of a poor schoolmaster, and was horn at Trie-Chatean, near Chaumont, 16 th Oetober 1742. He obtained admissiou into the college of Harcourt, where he so soon aequired sueh extensive knowledge that at the age of 24 he was made Prufessor of Rhetoric in the college of Lisieux. At the same time be went through a course of lawstudies, and was admittel an advocate of the parliament. Il is acquaintance with Lalande introduced him tor the stndy of mathematies and astronomy, and he was led to the thonght of explaining mythology by means of astronomy. After several communications in the Joumal des Savans, appeared his Mémoire sur l'Origine des Constellations et sur l'Explication de la Fable par l'setronomie (Par. 17S1). He was nowappointed Irofessor of Eloquence in the College de France, member of the Academie des Inscriptions, and shortly after a member of the commission of public instruction. Although he rather shmmed the storms of the Revolution, his reputation necessitated his becoming a member of the Convention, next of the Conncil of 500, and after the 18th Brumaire, of the legislative holy. He was also une of the is individuals who formed the nuclens of the lustitut National. His great work, Origine de tous les Cultes, ou Radigion Converselle (12 vols., Par. 1794), which he had long withheld from fear of offending the religious world, was at last pablished at the instigation of the Cordeliers' Club. This circumstance reddered the hook more an object of party bitterness than its own purely scientific character would probably have called forth. It made a considerable impression on France at the time, and no donbt originated the famons commission afterwards appointed hy Napoleon to explore Upper Egypt, which D. hail pointed out as the gencral source of southern mythology. No less attention was awakencd by his memoirs on the origin and spread of the Pelasgi, and on the zodiae of Denderah (q.v.). In his last work, Mémoire Erplicatif du Zodiac Chronologinue et Mythologique (lar. 1806), he attempts to demonstrate the unity of the astronomical and religious myths of all nations. He died 29th September 1509.
dulpuythen, Guillaume, le Baron, an illustrions Fruch surgeon and amatomist, was born at P'ierre-liutiere, in Limonsin, bth October 1777; edueated at the Cullege de la Marehe in Paris; and on the formation of a new schonl of medicine there in 179.1, was apminted to the wflice of posectour. In 1sol, he was appointed chef des trovanur anatomiques, and aplich himself with intense ardour to pathological anatomy. In 1sins, he was appointed assistantsurgenn, and later, in 1815, tirst surgeon at the HôtelDict. In 181:, he hecame professor of surgery to the medieal faculty, an ollice which he exchanged, in 181s, fur the 1 wofessonship of chinical surgery at the llotel-1hint. In 18:0, lomis XVIIf. conferred on him the totle of baron, and in 1 s , appointed him rusal surgen. Hu diod at l'aris, sth February 1835. 1). possossed extramblinary penetration in diagnosis, a fenctration that was genorally justitied by his boh and skilful ofntations, and an inmovalle firmnoss of nerve. Ho is the inventor of many ingenious mondes of surgical opration and of various smrgical instrumente. He has likewise made several
important diseowries in patholugical anatomy ; and although he wrate very little, almost nothing iniled, he formol a larye school of conhehtened surgeons in his native country. Among his works may le mon-
 at l'Hoted-Dieu ( 4 whs., Par. 18:0 183:4, mablished by sone of his students; and his Troits Theormup et Protique des Blessures mer Armesto fitere, chited by I'ailard and Narx ( 2 wild, liar. $18: 31$ ).

DUQUESNE, Ambatim, Marents, whe of the most cmincut naval oflicers of Fratnee, wats lemat at Diepe in 1610, :und trabol uniter his father, the eapitain of a ship, for the naval service. In the was between France and spain, he hrilhiantly dintinguished bimself at Curmma, Tarragma, lsincelnia, and other places. Dumis the monority of lowis X15., when the nary of France was inactive. he enterel the service of siweden, which was then at war with Denmark, 1). Iefeated the Danish Hect near Gothenbury in 1643, was elevaten to the rank of vice-admiral, and liy a succession of victories over the minted ilcts of lemmark and Ilolland, fored Dennark to conchule peace. He then returned to Frasce, where he found the Spaniards prepared to support Pordeanx, which Lad declared itself for the party of the Frompe in 1650. D. immediately collected a squadron at his own expense, and compelled Bordeanx to sulmit. He was next employed in pmishing the pirates of Algiers and Maroceo who infested the Mechterrancan. On the revolt of Messima against the Spanisi guvernment, France sent him to support the insur. gents in the Mediterranean. With it small force, I). gallantly apposed the mited Heets of Spain and Folland, commanded by De Fingter, and in April 1676, completely defeated his enemies ofll the corast of Sicily, in the vicinity of Mount Etnal. De Ruyter dived a few days after. France thas oltainem pissession of the island of Sicily, Lonis IIN. rewarded D. with the title of maryuis and a consideralle estate. On the revocation of the Eilict of Nantes, D. was made the only exception to the general decree of hanishment issucd against all lrutestants. His last achievement was the humiliation of Cenoa. D. dicd at Paris, el Pebruary 1685.

DU'RA DEN, between Cupar and ite Ambews, in Fifeshive, a small glen though which runs a tributiry of the Eden, has become famous on account of the numerous and beantifully preserved fussil lish entombed in its yellow sandstone. This sandstone is one of the upler heds of the ohatied Sindstune. It is develoged in D. W. to a thickness of 300 or 400 fect, ant is rich in the remains of ganoid fishes. They oceur in clusters and detached grouls, sometimes crowded together in an extraordinary manner, so that nuarly a hundred specimens have been counted on a single slab, abment tive feet square. They are found only in one thin layer, no fragment of skeleton or scale having been whtained in any other frortion of the sandstone. The speciminens are beantifully preserved; they often exhmit the rounded plump form of the liviug animal, in some instances not a scale leeng displaced; the seales retain their oriminal glistening chamel, very different from the white clalky aplearance they present in other localities. The specimens consist of two species of Moloptychius, viz, Andersoni aul Ihmingii: also of Diptrrus, Platygnathus, Phemeropleuron Andersoni, Glyptolumsi, Glyptopomu.., and Pemphectus. For further information wi this interesting lueality of fossiliferons remains, see Jura Den, by J. Anderson, D.D. Edin., Edmonston and Duaglas.

DULANCE, a river io the soutlt-mist of France, rises in the department of the Hant s-Alume near the latse of Mont dienevre, one of the peaks of the Contian $\mathrm{Al}_{1}$ s. It Hows through the dequement of the liasses-Alpes in a southerly dircetim: then curving westwam, it proceds towards the lilone, formini the lomelary between the deparments of Vancluse and Bomelnes-an-Rhone, and jums that river about three miles below Avinm. Its principal atlhents are the buech and the 'iblawn from the ripht, and the libaye, the Bleone, the Asse, and tha: Torion from the left. Its total lemeth is about 1 sol miles-1m part of its course is navigalle. Its current is switt and imputhons, and couries ilown with it great ruantitics of same and pelbles. harse quantities of timber are thated down from the forest districts urn its banks to Arles, anl thence to the Nediterranean. An aqueduct 51 mites lons has locan recently constructiod from the $D$. to Marseille. This Great work nut only surplies Marscille with water, but afforls water-pwer for driving nachinery, and irrigates an otherwise 3 mached arca of 25,000 acres.
DURA'NAO, or GUAD1ANA, and also recently named CIUDAD DE VTUTORAA, in honomm of the first president of the Mexican Confedration, is a city in Mexico, and stands in the siema Madre. at the clevation of 6845 fiet-almost a mile and a
 long. $104^{\circ} 3^{\prime} \mathrm{W}$. It is near the Culiacan (4. v.), locing 150 miles to the north-west of Zacatecas. It is regularly built, with a catherlad and other churches, and with convents, a theatre, and a mint; and the inhalstants, 20,000 in number. carry , m manufactures in iron, wood, wook, anel leat her. "The city gives name to a depurtment emotaining 54.50 square miles, nearly the area of Eandma, and 150,400 inhabitants-less than the population wif Elinlmegh.
DURA'ZZO (ealhed by the Turks Protsch, and by the Slaves Durts), a maritime town of Alharia, Enropean Turkey, is built on the rocky peniusula of Peli, in the Nimiatic. Lat. $41^{2} 19{ }^{2}$ N., lung. 19 $27^{-1} \mathrm{~F}$. It is fortified, and is a place of consiletahb. antiquity. Its situation in a fertile district gives it an export trade in grain, oil, \&c. ; but in recent vears, uwing to partial falumes in crops. and disease in olives, the expments have been small. 1). has large imports of liritish manufacturei goods; aml also of sugar, coflice, rice, suat, ant irom. I'alo between 9 (100 and $10,1000$.
D. is the ancient Eindumnus, which was fonderl alunt 627 1.c. by a conjoinel band of Corcyrazna ant C'orinthians under one Plaklens, a Heracleidan. It became a great and pupulous city, but was mucle harassed by the internal strifes of party, which ultinately led to the I'enponnesian Wir (y.v.). Onder the Lomans it was called lymachimm (whence its modern name), and became the seat of a Roman colony, and an important landing-llace for those sailing from Ermalasium in Italy to Greece.

Hore lompy was for some time lelenguered by Cexar. lyrrachimm attamed its highest consequence abont the cul of the the., when it lomane the capial of the Fyzantine equrehy of Now Eipirns. In the ithe $c$ e it was besiged by Theotoric the Ontro-Goth : in the loth and llth. liy the Bulgarians: and in 1081 it was capinred, after a severe lattle, by the Noman, liohert Guseard of Apulia. lu 1005 it fell into the hants of the Venctians; in 127.3 , it was wholly mestroyed ly an emthquake, hot was som after ichailt; and after several other chmeres, it was finally congumed by the Turks in 1512, in whose ${ }^{\text {rossession }}$ it still remains.

1) IT'RES (the Fuman Nareolurmm, whence its former nam, Mark-Inren), an anciont town of Lihenish Prossia. situited on the Fore, 18 miles east of Aix-la-chaple. It is suromaded with walls, and has several churches remarkable for the ir tine architecture $b$. has important manufactures of woullen dothe iron and steel ware, paper, soap, leather, nil, \&ic. In the vicinity are iron fomdries and other factories worked ly waterpower, obtained trom the later. Pops. sino. Itere Charlemarne, 13 his way to attack the saxoms, held diets in 7.5 ank $77!$ A. Is. After an olstinate resistance, D. Was taken and burned lyy Charles V. in 1543. In 1794, the French made it the capiat of the demertment of lioer ; lut in 1814 it was handal wer to linessia.
1)Ü RER, Albent, the fither of the tioman schonl of printinc, 'the prince of artists,' as his contrymen loved to call him, was born at Nürn. berg in 14\%1, wecording to an entry in his fathor's day-honk, ' on the day if St Prncentins, on a Friday of the hrily week,' His father was a homble pronis grellmith. "f whom the great manter said: • 1 is Alaly speech to us was, that we should aloumi in lowe to Cowl. and act taithfinlly towaris om meirh . bour.' I). was carefully whented and instructerl hy his father in the gehdsmith trade, and at 15 excented a piece of wink in chased silver representims the suren falls of thrist'- in reference to the tradition that christ foll seven times while beariner his cross to Momet talyary bene as a chiln, ilrawing was his ilelight, aud ho was wout to astomish by the pxactness with which he hrew parts of the homan borly, and even whole ligmes, also lines and cireles at the first stroke, withont ruler on compass. 1 lis father therefore bomel hma arpentice, in I4S0. to Michad Wuhlermonth, the charf Numberge artist, with whom he servell three years. Fron lton to 1494 he travelled in Cermany ame the Venetion states; and om his retmen, hes father "Dargaincel' with Hams Frei, a skilful mechanic of Nimmberg, to give him to wife his dauchter Agmes, whe tumen ont a perfect Ximtipe, with nothing to recmmand her hat beaty and omo dorins, whe embittered the whon conarse of his lifo, and, as his hife-bug frisme l'mklemer asserts, hatitured his Acoth, After wecivmer his dighoma with all the lumurs anl rimhts of a master, whtunem for his fanme drawing of orphens, he went to Vemee in
 of kit hutholumow, amb on of Ahan and lew, afterwaris inmint for the gallery at lature. Hac also visiten\} \{alumat, where it is sam that he nuet with himhand, who astremed him lingly, and that "achl minten for the wther his pertrait." After this jumary his fanm. spow wibly : aml the Emperor

Brises by the 1 minters, a costly dinmer heing served an vessels of silver the whole party coniluctin! them home fate in the might ly the light of many torches. His expenses were often lefrayed at the inns, and he was esented free from city to city. 1le says in his joumal: 'The people did olveisance unto me as if they were leadint some great lord.' D. wamly cmanacel the loctrines of the lieformation ; and his jumbal contains a long lamentation and prayer on hearing that luther hal been carried ofl to the castle of $W$ farthure. At Antwerp he records: - 1 was now overcome ly a strange siekness, of which I nover vet heard from any man.' This was in 152l, mid the 'strange siekness'- no other than consumption-tock git seven years to consmme his strong frame; he died in his native city, bith April 1.50 , in his 5 the year.
1): facility was almost incredible. He thought out lis works, and then excouted them withont sketch, and never altered a line. Of his coloming, Fuscli says: "Hurer excelled Raphatel in juice and lareath if colouring as much as Raphat excellet him in every wther quality.' His drawing was perfect. Sir ${ }^{\text {duant }}$ wre the presentments of his genins, he may be called the chancer of painting. In his portraits, he not ouly cought the expression, bort delmeated chamater and passion. D. was the inventor of the art of etching. He fomme wootenmavius in its infones. and raised it to be a pattern for all times; he also iliscovered the method of lamging out woodeats in two colours. Historical and other paintings by I. are to be scen at Vienna, Mmich, Praguc, Dresilm, and Nïrnberg. The oldest of his pictures extant is the portrait of himself of the year 149s, in the Florentine Gallery. His engravings and wood-cuts are si numerous, that with all his surpassing diligence it is known that for many of them the only gave the designs: 262 woolcuts are known marked with his name, the most famous of which are the 'Great l'assion,' the 'Little I'assion,' his favourite work, the 'Revelation of St Jom,' and the series eatled the "Trimmph of Naximilian,' a cony of which is in the Adrocates' Libraty in Elinburgh. In the British Muscum, there is a whlume with more than 200 uriginal drawinus by 1), fomacrly in the collection of Sir llans slome, also an exquisite carving in hone-stone, of the lioth of it John, amd a mumber of engravings, beqneathed ly Mr Nollekeus. Ilis own list of his work enumerates 12.54 jieces.

In the last three yrars of his hfe he publishad wink an ferspective and measurement, on fortifiention, amb om haman proprotion, of which last he only lisell to correct the first wolume. His life has been writan by Maller, lioth. ('ampe, and others. bondy rehimons and reverent, he was ilso of a - herfinl kemperament, aml was long chice manistrate of his mative town, where there is a brass statue of him, designed ly the famons seulptor lianch, and lis homes is still to lee seen at the corner of a street callod hy has mane.

1) ${ }^{*}$ REGS, in English Law, is the plea of a man Who has abliged himself tw pry or perform, or who hay momintech a mishembanom, that he was constrained to do su, and thorefore ought to be free from the cons.purnecs. There is boul duress of imprisument and duress per minces. Tomlins' biot.

of in few years. In ISl4, he was retumed for
his native county, and thongh he did not speak on many questions, he took part in all the more inprortant debates, oprosing the Corn-law Bill of 1Slo, the additions made to the incomes of the royal dukes, the Tudemmity Bill of 1818 , the six rapessive bills brought in by goverument to coerce the people after the great reform meveting at Nanchester in $1819, \& \mathrm{c}$. Two years after, he submitted to the House of 'ommons a scheme of partia. mentury reform. which of course was not ncceptel. In 1828 , he was raiscl to the peerage, with the title of Baron Durham of the city of Inmom. The was one of the fonr gersons who drew up the lieform bill, and sumported it in the House of Lords. In l83n, Lort D. was despatched on it mission to Jiussia. On his return to this country, his 'advanced lineralism' was proclamer at a dinnep given to Lord Grey at Edinhurgh, in 1834, and in virious other parts of the country. After a second mission to I'ussia, he was appointed gosernor- reneral of Comada, where he arrived in May 1830; bat on account of a misunderstanding with the home government, he took the extraordinary step of retmonge to Lugland in the course of half a year, withont eithor being recallen or oltainine the royal cousent. D. died at Cowes, Tsle of Wight, 2Sth July 1840. The left a son, the present Earl of Onilham, and three daughters.

DUGIIAN, or IDURION (Durio aithethentes), a fant-tred of the Malayan Archiplago, of the watural onter sterculitcene, of the sane trilse or sub-ariler (Bombacer) with the silk-cotton tree. It is a lofty trep, with leaves resembling those of the cherry, ant large bunches of pale-yellow flowers. The fruit is of the size of a man's head, rommish oblong, with a hard thick rind, covered with soft spines, su that it somewhat resembles a hedgehog rolleal up. 'The pulp of the froit is of a sort of creamy substance and elelicious taste, but has a smell which is at first very repmsive to Euroneans. Tersons acenstomed to it, however, miversally regard the $\mathbf{D}$. as one of the vely finest fruits of the East. It brings a higher price than any other fruit in the marlet in Indit. It coutains ten or twelve sects, as large as prigeons ${ }^{\dagger}$ gigs, which, when roasted, aris not inferine to chestmuts. Gne tree yichls abont 20f durians in a year. - The entivation of the D . has not yet been successfully attempetell in our hothouses, the great size of the tree forming one principal obstacle to it. The D. is nut a native of India, nor of cerlon, but is now successfully eultivated in the latter comntry.

1) U'RLACH an old town of Germany, in the maml-iluchy of Baden, is situatel un the river 1'lin\% at the hase of the Thurmberg, a highly enttivaterl lill, three miles east of Carlsruht. D. has mamfactures of linen, tolacco, chitory, vinegar, as also important fruit and grain markets. The envirus are covered with orchards. On the summit of the 'Thamburar are the ruins of an olld castle. 1 . is atatinn on the Manhem and Lasel lailway. Tople mom.

 (tum), at puns of grasses, distinguished from Andro-fungon-in which many botinists profer to include it - only Jy the ovate or whongo wate hermaphrodito suhnidets, with ghams that have three small tont at the extromity. The species atre gencrally ammal, tall, brnadfabed grasses, having strong bums lithal with a juary and stcecharme pith, and

Holcus Sorghum of the older botanists), also called Joar and Jowaree in India. It gruws $4-8$ feet high, with thickly crowled panicles. It is a coarse, strong erass; its grain is round, a little larger than mustard sech. It is a native of the East Indies, is extensively cultivated in Asia, and may perhaps le describer as the princijal corn-plant of Africa. It is also cultivated to a considerable extent in the south of Europe. It is sometimes cultivated in Germany, lut the summer is not sufficiently long and warm to secure its greatest perfection. The climate of Britain is still less suitable. D. yiells a very almodant produce, in this respect even rivalling maize, but the meal does not make good breal; it is excellent, howerer, instead of rice for puddines, and is prepared in various ways for food. The culins and leaves, although coarse, are excellent fool for horses and cattle, as is also the grain.The seeds of the shiloo or Scgarghass ( $S$. saccharatum) are more plasant to the taste than those of the common durra. It is cultivated in the warm parts of Asia and in Africa, and has a diffuse nad very spreading pauicle. The sweet pith of the culm is menten, and is also of value as a source of surar. This plant has been cultivated to some extent in the Yeronese, and its cultivation has been recently introducel into North America-where it is called Cimese Scgar-case-in order to the moduction of sugar. It seems likely to form an important new feature in American agriculture, succeeding well at least as far nouth as Mainc, and yielding sugar in large quantity. In Britain, it succecds only in the warmest parts. As a furage plant, it is very nutritious when young.-Kafir Corn (S. Cuffrormen) has a very diffuse umbel-like panicle, with branches bending down all around. The culn is more than the height of a man, and has a sweet jith. This species is largely cultivated in South Africa, both ly Kafirs and by the colonists. Iy the latter, the grain is chietly used for feeding horses.-S. Habpense is a troublesome weed in the fiells of the north of ltaly, like conch-riass. The sweet maners of the roots are kept by the apothecaries of that country as a substitute for sarsaparilla, umder the name of Curuignone, or Smiluce dolce.

DU'RRENDERG, a small town of Prussian Saxuny, five miles sonth-cast of Merseburg, deserves mention only for its salt springs, which produce about 20n,000 bushels of salt annually. Pop. upwarels uf 200 .

DU'RRENSTLIN, a village of Lower Austria, is situated in a highly picturesque locality, on the left bank of the Danule, about 45 miles west-corthwest of Viemna. It is chicfly notable for the rins of a cistle. which stand upon a rilge of bare ruck werlmking the town. A peculiar interest attaches to this grand but desolate and shattered fortress, from its haviner been the mison in which Tichari ('rumele-Lion was contined ly Leopold of Austria, for fifteen months. lions.500.
0) RSLAEY, a town in the west of Cloucestershire, imml pichurespue secmery, at the lase of a sterp beech-coverd hill, and near the Coteswohl hills, 15 miln's south-sint $h_{2}$ wost of dioneester. DUTENS, Lotre, a French writer, was hom at Timus, lbth January 1\%io. Being a Protestant, lue sourlit to make his way in Enclind, and occupial himself at first in teachine and in self-improvemont. At last, he accompanied the English ambassador to the court of Turin as his secretary, and after wames remaned as charyn-d'ufferes, a pmsition which he occupied twice subseguently. He Lehl a pension, and was presented to the rich livins of Elscha, in Northumberland; and was hikewise made Histnriographer Royal of Great Britain. IIe dien in 1S12. IIs numerus works display great versatility and linowledge of the world. He umbertook the first comprehensive, though not complete, clitimn of Lcibnitz's works ( 6 vols., Geneva, 1769). In his Recherches sur l'ormize des Décourotes altribuíss aur Modernes ( 2 vols., 1766), he rates the linaw. ledre anl invention of the ancients by far tan high. The Tocsin (Fiome, 1769), which afterwarts appeared under the title of Amul un Bon Sons (Lond. 177), contains some shalp attacks in Voltaire and Tonssean. There is considerable historical interest in his Mistuire de ce qui s'est purssés pour le Rotuthissement dune Rofyonce en Anyleterve (Lom?. 1759). II adsn wrote several able treatises on mumismatics and wher suljecets. In the Considmutions Theoluriques sur les Mazens. do reumir toutes les Eoglises thrtionnes (lar. 17̈s), be proposed that a council should compose a confession of faith gromuled on the decrees if the conncils of the first six centurics. His Mimoires d'us I'oyctuetr qui ser requase (I'ar. $15(60$ ) mat with general favour.

## DYCK-DYEING.

sulijects by Rubens or Tan Dyek, or protueed in any of the later schools, will stand comparison, for purity of feeling ann appropriate technical execution, with the wrots of the earlier masters ; and the allerorical pieces so much in vogue in the loth c., are little in accorlance with the jdeas of the present time. lint the portraits by Van Dyck are all interesting and valualile histories, recorded with marvellous truth and vividness, of characters who playen? impmotant parts in an era noted for great events-anm as works uf art will rank with the probuctions of the least schuols.

Tan Dyck's etchings are armimble. Several if the portraits in the collection of portraits of artists, are etched by him. The impressions of those that were thrown off, when the beads merely were etcherl, are of great value ; indeul, in expression anl spirit, they have aever been equalled.

DYEING is the art of staining or colouring yarn or cloth. It has been practised anons eastern nations from time immemorial; and in the sacred writimgs, we real of the vestments of the himhpriest being dyed purple, of linen eloths being dyod blue, purpib, anil scarlet, and of rams' skins being ryen rea. 'the famous Tyrian purple is believerl ti) have heen discoverel by an inliabitant of 'Tyre fifteen hmolred years B.e.: and immediately afterwards the Tyrian murple beeame the barge of royalty, and eloth fyed with it commanded a princely price. The Egypitians, Greeks, and liomans practisell the art of dyemgr and gradually it liecame more and more wide-spread as eivilisation advanced, the discovery of America and other lands materially increasing the number of dye-stulfs. In earlier times, dyeins was much more extensively followed as a domestic art than it is at the present time. In the Highlanls of Scotlant, lowever, females are still in the habit of dyeing eloth brown by immersing it in a solution of copperas (sulphate of iron), and then treating it with a decretion of smmach, logwond, an! crottel (Pemelie omphatoles), a lichen wheh eovers many rocks and trees in moist sitmations; Ulack, by immersiner the eloth or yarn in an infusion of the bark of the aller-troe (Almus ghutinosti), along with copperas and a little sumach; yellow, by the common heather (Colluna rulytros) and alum: riol, by the roots of berl-straw (fithum rerum) and alum, \&c.

The Dye-stuffs ( $\mathrm{I} . \mathrm{v}$.) employer in the rarions processes of dyoincs are numbrins, and when two on more are associated togethor, many dificrent shales and enlours are prohlucel besioles the origimal conlour yiehted lyy each. The dyeins materials ar" prucured from the mineral, vpictalale, aml anmal kingloms, and are often very costly. The arrangements connected with myeng merations are at times simple, whilst at other times they are complex, and require the rratest care ans] skill un the part of the dyer. In eommomication the dew ineligo blan to wonllen cloth amd yarn, a vast is takin, alunt $1 ;$ ur 7 fect in diameter, and $S$ to 9 fout in chepth, and nearly tilled with water, alomg with

 Aftur the remisite lwilmes, and the allition of 7 ur $\$$ Ihs. of lime, to furm an alkaline linata in which the indien ean he held in solution, the whole is well elosed wrer with tiohtly fitting womlon covers: and in a day, the putrad fermentation of the worl innl bran procecols, the rosult uf whiclo is to abstrat tha oxyeran froms the blue indian, the conlome of whinh is Eralually relumed tall it assumes a y yllowish colour, anul the sulation them rentans indern white. if wonllen yarn or choth is nuw sippeltin this liquid, it camos mut of at yellow that, from tho attachment of the white indige snlution; but when cxlnsed
to the air, the oxygen immediately begins to act mon the white indro, comlaining with it, so as to forn oxidised or bhe indigo, and as the process of oxidation proceded, the yarn or eloth becomes first of a greenish and then of a blue colour. If the cloth be again soakel in the yellowish solution, and sulbsequently exposer to the air, the depth of the bhe colour may be inereased step by step, till it arrives at that reep shade of blne so well known, especially in the coarser quabities of woollen cloth. In the dyeing of eotton with indigo, the vat is prepared dificrently. The indigo is first ground into a thin paste with water, and afterwards placed in a vat with protosul ${ }^{\text {phate }}$ of iron and milk of lime. The lime (CaO) takes the sulphuric achl ( $\mathrm{SO}_{3}$ ) from the sulphate of iron (boso, forming sulphate of lime (CasoSO ${ }_{3}$ ), aml liberating protoxide of iron (FeO). which immediately abstracts the oxygen from the hine inligo. relucing it to white indigo, annl the latter dissolves in the excess of lime present in the rat, yieliting a colourless solution. When cotton cluth or yarn is lippel in this, it comes out of the vat alumst colomless; but on exposnue to the air, the indigo beemmes ruxidised, and the eloth passes ${ }^{\prime}{ }^{\prime}$ : a reen. and nltimately to a deep-blue shade. The cloth or yarn is then washed in water, and aftorwarls soaked in very dilute sulphurie acid, to remove any oxite of iron remaining attached, and rewashed in water, when the blue colour becomes more lright and clear.

In the fixation of colour upon cloth, recourse is often had to a morlant (see Calico-pfintisg), which aets as a midele avent, and attaches the colour to the eloth. 'The principal mordants are alum, cream of tartar, and salts of tin. Previons to the application of any colome, the eloth or yarn must be well cloansed from grease, oil, \&c., by scuoring in sula or in soap, ant except where the material is to be dyed of a dark conmms, the grods are also snbjectel to the process of hleaching. In the case of falories which requiro it smouth surface, the preliminary nueration of singeiny off the loose hairs is resortind to. see Culdeo-frisinct.

Dyense of corros.- The following receipts for the dyeing of cotton aplly to 10 lbs weight of cotton yarn or cloth, which is found to be the smallest duantity capalle of being well dyed at me time. The propurtions of each ingredient may he altered, however, so as to corrosponnl with tha: ruantity of eloth wom to le operated upon.

1. Cummon Bhecl:- Take ? lhs. smmach. and treat, with hot water: steel the goonls in the hat decnetion for some lours: wrine wit wash for 10 minutes in lime-water, awd for 30 minutes in a solation of 2 lbs. copperas. Wash the monls well in cold water", sometimes repeating the troatm"nt with lime and rewashing ; then work the anorls for : 30 minutes in a wam solution of a lhe of logwool, and artur warls with 2 oz. chpreas; work again for 10 minmtes; wasl, amil rlys.
 with the longont; and whath : pints of iron lignem
 limet hlank is ohtamos.
 promed as at 1.
2. Prourl. 'l'reat the enonle witle a yellow dye: then work for : in minutos in a deeoction of a Hos. lima wool and is a\% logwoml: lift and work witls 2 or. alum fun 1.5 minntes: then wash, and dry.
3. Cutatu liromen.-lmanerse the groods at a boiling tomprature in a lecomotion of catecha; then Worl for : : m minntes in a lont sulution of 6 ow hinhomato of potash. Wash in hot wates, and if the lather contain a little sarap, the enlour will be improved.

## DYEING.

6. Chorolute or French Eromen.- I'ye the goods with a spirit yellow; then treat for half an home with a solation of 3 lhs. of logwerl; base with a lithe rod liquor: work for 10 minutes; wash, and dry.
7. Rev.- Make a lot solution of 3 ll s. of sumacla; introdnce the goods, and loe shand till the liquor is cold: then wring out, and work in watol enontaming in each gallon a gill of ral spinits (1mo.
 to a mixture of threc parts of hydrmburic acil, one part of nitric acid, and one of water in the cold) for 30 minutes; wring and wash well; there work the coods for 30 minutes in a lok"warn deeoction of $;$ Ibs. of lima woont, and 1 lh. of fustic: ath as gill of red spirits; work the geouls lomger : wash, and dry. The famons Turkey-red is impurted to the cloth lige first impregnating it with an oily w fatty sulsetanoe, and then subjecting it to a decoction of malaler. It is whe of the most durahlo of all colours.
8. Fellow or stroue.-Wiulk the goods in a weak solntion of acetate of lewl; then wring out, and work in a dilute solution of lishromate of putash; wring ont, and work again in the leul solntion; wash, and tby.
9. Leghom Yillow.-Proced as at 8 , lint adll a little arnotto liguor with the sulution of bichromate of potash.
10. Spirit Frllom. Work the grouls throngh a weak solution of protochloricle of tin for io mimuters; then work in a solution of fucreitron bark for 15 minutes; lift out, and work arain in tin solntion, and wash in cold water.
11. Orange.-Froced as at 8 , and aft wards pass throngh lime-water at the boiling-point, ultimately washing in cold water.

1:2. Blue.-The goods are worked in varions strengths of solutions of salts of iron, such as nitrate of iron; wring out: wash in water, amsl then work in solution of yellow prussiate of potash; wrigg out, and wash in water containine a little alum. The various shates of blue may lee obtained ly using stronger weaker solutions.
13. Green.- Dye the cloth blue; then work in red liquor (acctate of alumina) ; wash in water: work in deonction of fustic or bark; raise with solation wit atum: wash in cold water, and dry. The tarkur sharkes of green, as olive or luttle green. are lrousht out ly the use of sumach ami logwoot along with the finstie.
11. Jure or Lilar.- Wrork the cloth or yarn in red spirits (see 7 ), than in logwool solution at a temperature of $140^{\circ} 1^{\prime}$. arloling a little red spirits, red $^{\text {a }}$ liquor, or alum; wash, and dry ; or dye the cloth blue (12); then work in solution of logwood ; ald alum: work again: wash, and dry.
15. Purple-hoak the foomls in a wam dreoction of sumach till coll ; work for an bour in red spirits; was!l; work in hot solution of logwoul; then add a little red spirits, and work again; wash, ant dry. Th, various sliades of pmple may be obtained hy altering the strength of the chemicals; the more sunach, the browner the hue, and the more logwood, the bluer the purple becomes.
16. Lazenter or Pefort.-Work the goods for 20 minutes in spirit-plamb, a strong sohation of lorwood, treated with abont one-sixth uf its rolume of a solution of tin, malle ly dissolving tin in six or seven parts of hycirochloric acid, one part of nitrie acid, and one of water); wrin! out, and wash well in cold water.
17. Saffower Lereender is olntainct by dyeins the goods a light-lulue, then working in decoction of safflower, which places a pink on the top of the blue.
18. Drab--Work the coods in a llecoction of sumach; lift, ald copleras; rework; wash in
water: then work in a mixad dreortion of fustic, lima woml, and locwoml: rahn with it litule alom; wash, and rlyy. ('ictorla is aceasionally employed.

Hems: obe Wrom. ln the lyoing of worllen youll and choth, the virions stomp are used warm, but the washinge in walor are dome cald. Care muet

Q5. Fellow-from a bath of tartar amd almo ; them a decoction of bark, sumach, fustic, and red spirits.
26. Shur.- Varions shades may le obtained from immersion in salts of iron, and them in solotions of veliow prussiate of potash (see lo). Also wonk the wool in a batls of arm, alum, and indiero extract.
27. Gum.-Work the gooks in : hath of fustic, arool, and alum, and thereaftur in a solution of indion. The dark shantes of green, sheh as olive, are bronght out by a bath of fustir, logworm, mabler, aml peachwomd, aind atterwards ni copperas.

2S. Jinet-from chilnar, loorwroml, larwond, ne camwood, and peachwoud; as also alun. The add. tion of eojpras lrines mut a jure tint.
29. Dreble- The manifullal shadus if this enlour are 1 rocured from variable strumeths of decoctions of madiler, peachwoul, logwood, fustic, assomiated with alum and corperas.

Whence of Silk. - The "mrations connccted With the dyeine of silk are simbar to those already sketchal sint, bat a more thommels scouring of the raw material requires to be mande, so as to r"mose all the gum and wax lelonging naturally to the tibue.
:30. Bhack is ohtaned ly working the silken material in eopperas (sulphate of irmi, then in logwood containmig some chamber liguid. and repating the treatment with copperas aml lorwood till the requisite shable is procured. A luttle nitrate "f iron tomb to give a more full, were hlack; and alum and white soap are also usud with alvantage. - cectate of cupper is wecasionally used.
:31. Bhue Black:-- Iye a bue as at 1:- amu then 1rmeed as at 30.
32. Pronn.-Obtain an nange ly immersion in a solution of anonta, then treat with eqpperas ; and introduce into a lath uf fustic, logwood, archil, and a little alum. If a more vellow tint is remuired, atht more fustic; redness is obtained by adding beachwood, and blueness by the arlition of logwood.

8i. Reds are obtamed from peachwood and fustic, aud thereaftor red spirits. Annotta is used in gettin!s up the searlet shades, and cochneal and saftlower in the more expensive red dyes. Iinbies and maroons reguire cullurar.

Bt. Pind-frons safluwer, associated with sullhuric acid and crean of tartas.
35. Urampe whl Yellou-by treating the goots with more or less strong solntions of anmotta, associated with alum and white soat.
:ib. Bhepefrom salts of iron and yellow prossiate of potash; ur from solntions of sulphate of indigo, assisted with a little alum.
:i. (rreen-from sterping in decoctions of fustic and sulphate of imbligo, along with a hattle alum. The darlacr shades have eopperas akled and lonwood.
:IS. French anel Peerd JVhit.-Wrork the silk in a lather of white somp to which archisl or eurlbear las been alded. tu give the repured shate.
39. Dundifrom deoctions of sumath, fustio. Jorswom, aml more en less colleras, acoording to the deptle of shade reguired.
 tratile fabries compused uf mone than one kind of matorial. generally repuires two or more jrocesses, as the plian pharsued in dyeing wool is seldom capable of fixines the colvir upon cotton. The chstomary flan followed is to immores the fabric in the requisite haths, to dye the woml, and then to treat the partially dyed materiad in the manner fomm suitable for cotton. Oerasimally, the woollen thend of the cloth is lyed of one colnin, and thereaftor the cottom is treated so as to acquire a different shate of ewbor. The prommensis of a cobomed pattern on dofh has already hea considered under C'alico-pisivilsia.
1)YER, (ilounge, an asticuary amel schobar of sume eminemet, was hom in Lumton. Namely bis, 17n.5, and was chucatol first at ('frist's Huspital, and afterwarls at Emannel ('ullece, 'mubridue, whell he entered in 177.t, and where, after four years strudy, he tomb lisis deyrece of IB.A. Jharing the inext fonrteen yars, be was varionsly emaded, clactly at cambrilen as uslocr, tation, amit as momister (in tha litpotist denomination), lint hor dinilly settled in Jombon in J7:2. Here be dowoted himself prineipally to literature, and prolmeal, amomis many works of loss note, the IIStor?

 to nasazinos. He died in Lomlon in 1841 . li, wass atman of remarlable strainlat forwambess and Juncesty of chameter, grabities whinela are every wher" desernible in his works. Ne was alse it prect, $^{\text {nen }}$ althnory now forsotten, amb never famoms.

 as the sumbees of emomrimg mathor, are niostly
derived from the vegetalile and animal kingdoms, the far greater number of them from the forner. To the anmal limedon, and to the class of Insects, we are indebterl for Cochinal-aurl consequently for ('urmine-Kirmes, and Loc, and less direetly for Grtlls. The Tifrim purple of the ancients is also said to have heen a protuct of the animal kingelom, obtained from a molluse.-The dye-stulfs ohtainod from the vegetalde linglum are numerous, and in every part of the world there are some in domestic use, which have not liecome articles of conmerce. such are those dye-stutl's of the Highlands of Seotlaml, mentioned in the article lyerng. Dye-stuffs are procured from pants of widely different natnad famblies: there are some indeed in which certain colounine matters appar to be extensively prevalent, ass in labincue (madtley, \&e.), amd the genns Cosalpinat (1]. v.). They are also obtained from almost all diftorent parts of phants, as the heart-wood (flurom, $n$ ) of the stem (longrook, Brazil-wood, ('amwomt, Fustic, \&e.) ; the hak (Ahler, \&c.), the ront or its hark (barherry ront, \&e.); the leaves and wher hertacrons parts (lndiyn, \&e.); the corolla (Satilower) ; the froit (French berries, Annotta, \&e.) 'The prinejnal dye-stults are the following: Alkemed (c-t.), nsetnl in dyeinus vamons shales of lilac, lavaler, and violet, which art, however, liable to fode on exposme to light. Alocs, obtaned by evalorating the juice of the alue, which is grown in the bast and Il est Indies. Sicily, Italy, and Alalta. It contains a hown colouring matter namel $A$ lox lin. which nay lee employed in the pros duction of a lown tint. Arnoto ( $r$. r.), ensployed in imparting the varions shades of yellow, orabge, and scarlet. to silk, woml, and cotton. Archil, yidding, when infused in water, a erimson dye of great boanty, though fmgitive, and used in grivinif a tinish to woul and silk which have becn pevionsly dyed. Burbery root, imported from the Einst Thalies, and containing a yellow colouring matter callod hobrim. Brosh-woul, often callded patrh-mone, enntaning hrotiliot, which, in contact with the air, Fiells a rich red colour. Camuool (1. Y.) or Purvine, has a red colour similar to that of limeil-wool, is genomily cmployed in the fum of a coarse fowder, ind reatily imparts its conome to water. Cutchu, yields a reddish-brown sulntion in water, and leerforms an inuortant oflice in the dyeine of many shades of brown, black, amd orecos. Chece ( 1 ! $v$ ), cmplnywl in the dyeing of worl and erotton ut ant willererellow eolours. Cochencel, emsploved directly, miniliectly in the form of carmine (extrocted frem the cochineal), in impartines the most beantiful real and erimson colours. Fianch,

 a fuswating yollow dye. F'ushe, the dincly divided

is extensively used in the dyoing of eloth and yarn real, murple', hrown, \&c. "Mumbit or Imtion motder is usced in Imiat instrad of madur. Ster celron yiells a rich mange-yellow, or yollow red dye, capald, of Teing afterwards malo it bown and when used after at Hue dye, it anmees tha

 yiolde a red colome which, atome with uther sul. stances, may be altered to riolet, whllinh loown, and searlet. S'muach, vecasimally vallowlymuat
 the teman and gallic acid it contams, wheh cmahles (hecections of sumach to bu hed with great effent for imparting whth or solility tw othor enkors. Twromic, or fulien seffion, is comployed as a yellon dye, but is vary funitive. It eld. or Itold, prodnces is rich hat fugitive yallow, Howel is employed as a blue dye for wowlen and sills yarn
 is a now yellow dye-stall procural from the sumd. vessels of a plant lelonging to the family of erntienese, and imponted from Eatavia.

The alone list of dye-stuffs comprehems those which are olotainol, ilivectly or imlirectly, from the vergetalile and amimal kinestoms; and a mow lengthened notien of the sulistanes will he frome nower their respective names. Other lye-stuths less generally usal are also moticed in the artiel's devoted to different onders and genera of plants. 'lhe metallic salts and compunds employed in dyems will be specially noticed muler the varims metals; thus for acetate of lad, see leano ; sulphate of irom, sue Iros; \& \&e.

Condrar Colours.-The most recent hismery of importance in dyene, is the extraction of coloured sulstances of great beaty from analtar, and the application of these to the colouring of cloth. At the present time (18GI), theser rlyes of coal-tar origin are most extensively cmploned, ami give rise to the fashomalle colnars mamed Aniline purple, Tyrian purple or Manve, Violine, Fuseine, Fuchsine or Jlasinta, Solferina, Bleu de Paris, Aniline green or Limetalline, Azuline, \&c. It is on!y, however, within the last four years that these dyes have become practically known, though the proliminary discoveries in connection with their extraction were male in 18\%6. The ondensalile probluct or gas liguor obtamed during the destmactive diatillation of coal in gas-moks, consists of arpeons matter holling salts of ammonia in solution, am tar with naphtha. The tar consists of a mumerons class of bolies, of which aniline aml benzole are two. The aniline is present in minute quantity; and for mantiacturing bur peses, means are generally resoried to for the conversion of the benzole of gas-tar intor aniline. The pracess followed on the commertial scale is to act nom the benzole by nitrie acil, ly which it is converted into nitiobenzole, and thereafter, by the action of acctate of the pootoxicle of iron, it becomes aniline.

Initine Purple.- In the preparation of the dye known as aniline purnde, solutions of equal equiralents of sulphate of amiline and bichromate of putash are mixed together; and when the reaction is complete, a black procipitate is obtained, which is dried, and then digested several times in coal-tar naphtha. to separate all resinous matter. The residue is dissolved loy sucessise quantities of alcohol; and the solntion leime placed in a retort, the alenhol is clistilles of, and the aniline purple is left is a beantiful bromaconnared substance. Aniline puphe is slightly soluble in colil water, more so in bot water, and is realily dissolved by the alcohols amb aniline itselt. It is nearly insoluble in ether and naphtha.
lionerige is mest readily preparend on the com-

 sulphato of :milum :mil biliter tha where for a shomt
 mataimen, which is "rapmated then tor smatl loulk,

 solnha in alcolm, and yields a wory minns. cranmon

 It is soluble in water, lint mut in maldhat.

Todine is procured hy the oxidition of aniline, and the: poness gnerally follownd is th hate as

 and filter hot. A purple lugul is obtainel, wheh is briles with patash thll the amilime present is malatilisend, and the colmurine matter is preainitatonl, when the latter is theown a filter, washes wath water, and dissolved in a dhlute solution of tartarn achl. On filtration. the colcourel lipuill is ツalnarat to small budk, railtered, repreciphatal ly potam and somba, and the presiphate being diswleme in aleohol, yinhs an alerhanie coloured suhation, which on distilling off the alcohol, leaves the wind as a hrittle lowize eoloured substance. Vinline is wry slinftly suluble in water, is readily dissalseal by ale hon ame is insolulile in cther and maphat
 auhydrous himbloride of tin by degress to :unition. The materials are constantly stirred durime the "川neration, to kecl down the intensity of the athon, ani the result is, that moch heat is ewherl, the mixture beomes pasty, then lifuid and brown; and as the temperature approaches the loiline juint, it becomes is lark, amost black liguil, which in very thin layers presents a rich erimson colome This liquid is hoiled for some time, much water added, the whole rebriled, so as to volatilise any free aniline, and chloride of somlium (eommons salt) addel till saturation, when the fuchsine or masenta is precipitated as a golden green, scmi-solid, pitchy substance. Any resinous matter still remamins may be separated loy digestion in benzole. This dye may also he oftamed by actine mpon aniline with nitrate of murcury: Fuchsine or magenta is springly soluble in water, dissolves to some extont in alcohol, and is insolntle in cther and haphtha.
Bive de Poris is preparel by heating ? parts lag Weight of lichboride of then and 16 parts of aniline
 for 30 homes, when a bine produet is abtaned, which is soluble in alcolno, and erystallises therefrom in fime umbles of a lively lhe colour. Blen de laris is solubld in water, aleohol, wood-spirit, and acetic ach, and insoluhn in ether and hisulphuret of carhon.

A milaue tirn or timeruhline is obtainel by acting mon a hyilrochloric acid solution of aniline by hlomate uf potash, when the anibine lwemes uxidismi, and yinds a dull green precipitate, which on drying becomes an olive-reen resilue. It is insoluble in water, alewhol, cther, and benzole. and in the presence of a frow atol the ermen ember impores in appar. anee, thengh it returns tos its original shate when the frow adid is removed.

Guimuline or Chimuline is present in eoul-tar, mil may be omployed to vield thre mburins matters-a violet, a bhe, and a green; hat the prouesses as yet followed in their preparation beloner mome to the laburatory experiments of the scientific chemist than to the practical operations of the manufacturer.

Picric Ac:al is oftained ly actiny upha may womic sulstances, such as indico, amiline, carbolic :unt, saliciu, silk, aloes, omm-resins, de., ly nitric achi. On the commercial scale, carbolic acid is Gelpeally employed, aud it is first treated with nitric acin of slightly less dansity than 1 Bon (water $=1000)$, ame afterwards boiled with stronger aciul, whon it passes into picric aciol, and is precipitated on dilution with water. It can he purified hy recryathisation from boiling water. Pure picric acin crystallises in lamina of a pimuruse yellow culour.
A antine is the only other eolourins matter of practical importance ilerival directly in indirectly from wall-tar. It is a brittle, nom-crystallisable sul). stance, with a eopper-colournd metillic alumance. It is sparingly soluble in water, lut is soluble in alconal, yielding a fine blue sumtion with a shade of red. Treated with concentrated sulphuris acid, it beeomes a fine blowdered liguid, which, on dibution with much water, gives a ral precipitate of azuline.

Pittuent is a blae colouring mattor oltained frou cometar.

Ibye iny of sitk an? Wrool hay the Coal-ter ColomseThis deprartment of the oprations of the clyer is rey sumple, as the sill and woul tilnes passess the lower of taking up and fixing the majonity of these colouring matters with freat rapility, whenever the rarn or textile fabrie is placed in the wessel containing a solution of the colutr, In the dyeing of silk with aniline purphe, violine, and riseme, the alcoholic solution of the colone is lilutad with eight times its valume of hot water ardiduated with tartaric acid, and thereafter treated with a larer quantity of cold water. The silk is merely worked in this comparatively weak solution of tim dye till the shale of colour is deep enough. 'The allition of a bittle sulphate of indigo to the dye. yat assists in bringing out a mure elecited bhe tint. The same result is oltained by tirst lyeing the frums with I'russian blue before immersion in the coal-tar colour. When silk is to he dyed with fuchsine, ficric acid, chinoline blue or chinoline vindet, the yools require only to be worked in watersolntions of these colours. A little acetic acid anded to thin vat contaming the fuchsine or pieric acil is anlvantageons, and if a solution of sulphate of indign is mixal with the solution of pierie acil, the ermols acture a tine green colume.

Dzaline is attached to silk with more difliculty than any of the preceding colours. 'The sidk requires to he worked first in a solution of azuline acidulated with sulphuric acid, and thereafter the liquil is raied to the boiling-point, and the silk continuel to be worked in it. The gools are then washed in water, workell in a bath of soap-lather, rimsed, :mat dinished in a weak acid hath.

Trow is rlyed with aniline purple, violine, voseme, fuchsine, and chinoline by merely working the yarn or cloth in a vat contaning a water-sulution of the colouring matter at a temperature ranging botween $112^{\circ} \operatorname{and} 140^{\circ} \mathrm{F}$.

Cotton has not the power of firmly attaching, directly, coal-tar colours to its tibre so as to resist the action of soma and of san: When the cotion, lownew, is treatod with a solution containiner much tamin, such ats a feroction of sumach. or gatls, for an hane or so, then introducel ints: al dilate solation of ahhm on stamnate of somb, and, lastly, passed int" a dilute aciul liguil, aml washel in witer, it acepuires is eroat pow of firmly attachus aniline parple,
 Whenere it is werked in a dye sat contaning these colnmmer matteres. This primiphe of the attantsrambe of these colours to raten hy mans of a sumbint of tangin amb alum, may loe aphlied in
printing patterns umon eloth, as in Calico-printing (q. v.). The pattern is printed on the choth by means of tamin and alum dissolved in water and thickened with fum; and afterwards, when tho pronared foods have been introdnced into a lut dinte acid solution of the colouring matter, the lye becomes attached to those parts on which only the tamin has been printed, and laves the other parts uncoloured. Another mole is to mix the lye with albmen or lacterine, print on the cloth, and then subject to the action of steam, which congulates the albumen or lacterine, and at the same time fixes the colom on the cluth.

DYING DECLARATION. By the law of all mations, the declaration of a party, made in the immediate prospect of death, relative to the mode of his death, is receivel as evidence. The gromad of this exception to the general rule of law, that hearsay evitence is inamissible, is thus clearly statel hy Lorl Chief Baron Eyre: 'That they are declarations made in extremity, when the party is at the point of death, and when every hope of this world is gone; when every motive to falsehood is silenced, and the mind is inducel, lyy the most poweriul considerations, to speak the truth: a situation so solemn and so awful is considered lyy the law as creating an obligation equal to that which is imposed by a positive oath in a court of justice.' In Scotland, the dying declaration of a witness is admissille even though he is not himseli conscions of the danger of death. In this respect, the law of Scotland differs from that of England and America. The general rules as to dying decharations are, that they cannot be received in any civil case, and in criminal cases only where the death of the deceased is the subject of the charge, and the circumstances of the death are the subject of the dying declaration. They must be made, excelt in Scotiand, with the full knowledge of impenting death; they are subject to the ordinary rules of law as to eapacity to give evidence; they must relate to facts only, and not opinions, and must be freely made; they must be complete in themselves, and if it appear that the dying man intended to qualify them, they cannot be received. See Taylor on Lridence.

DYKE, or DIKE (Dntch, $d y / k$ ), an artificial monnd along the bank of a river or sea-shore, erected for the purpose of preventing immilation. The term is from the sme root as dig-hence also dith, or the hollow from which the dylie is formed. The French employ the term lerie to siguify this species of embankment, of which there is a notable example in the leves rrected along the Mississipli near New Orlcans, The principle on which dykes or levées are formond is cery simple. The embankment must be of sufficient health and height to resist the pressure of the water, and must be constructed with that casy slope which will allow the floods to rise withont any particular impeliment. This is ruite understoon in pactical enginecring. Flowing water must not be almuptly resisted, hit suffered to rise gradually and expeni itself. it is accordingly of the first consequance, in all attempts to restrain water ly embanking, that the monmis should possess not only magnitude, lunt a very gradual rise in the side which has to resist the impart of the floonl. For want of attention to this methent of embanking, there las often hon moll inoffectual dyking of the sea and rivers liable to do damare ly dooding.

In mu comatry has the ereetion of dykes heen carried tos such it longth as the butch Netherlanls. (onsisting to a large extent of low meadow-land, formel of matorials lrought from switzorland aum Germany lig the ILhinc, there is a cunstant liability
$72:$
to be deluged by the several hrandese of that river previous to their entering the sea. huspired by a sense of their jeriloms situation, as well its it naturally industrions and painstakine disposition, the Dutch have for ages been distimaishon for their ingenious system of river-mbanking; till at lenght the dykes of Jolland are spwen of as ahmost one of the wonders of the work. While the country generally is guarded against seatmundations by high monads of samd or duans, created by the deposit of light simed hlown from the lavel shores (see Ifund), the interior is sectured from the rivers by the system of dykes here referred to. These mamparts are in aprazance long heon mounds, hroad at the lase, grabluated in their slope, and often of sufficient wilth to almit of a canal or roan, or both, being fomed along the top. To give strengtls to the falmie, uillows are planted and also interwoven like wieker-work on the sides. Corried along the banks of fivere, and in some phaces aloner the margin of the sea, ats well as crusswase in different parts of ILolland, a singular not-work of embanking is presentel, which answers the donble purpose of a protection from imundation and a means of having canals, by which superflums water pmoped from the meadows, or polders, may lie run off into the sea. The whole system of dykines is placed mokr local and general superintendence, at a cousiteralide cost to the pullic. One of the most gigantio of these dykes is that along the llemer ; it mursures about six miles in length, 40 fect hoond at the stmmit, along which there is a geme romil, and duscends into the sea liy a slope of 200 fect, inelineld about 40 degrees. Nutwithstanding the precantions taken, one or other of the lower lianches of the Thine occasionally overflows its hanks and lays a wile district of combtry under water. One of these immations took place in the winter of lscio- 1861 , ant, committing immense havoe, was the canse of mach loss and suffering. A good example of dyking for the parpose of dramage is shewn near Itardem, where it has facilitated the withdrawal of the 11 aerlem Sea (q. b.).

DYKES. In volemic Ristricts, rents frecuently ouen which are filled with molten materials from helow, that subseguently solidify, and from solid walls, fillieg the fissures, and seprating the edges of the disjointed strata. To these walls, geologists aply the term dyke, a Scottish word for a wall or fence. Similar walls of intruded matter occur in stratified rocks of all ages, and have heen comected with volcanie ermpions belonging perhaps to every geolonical eprech. They consist if similar materials to whatever period they belong-viz, lava, either in a granular, compact, or glassy condition. The dykes connected with Vesurius have heen minntely described. Those in the great escarpment which Comma presents to the mulem crater of Tesuyias permit of a eareful examination. They are chiefly vertical, and traverse at right angles the heds of lava, scorie, hreccia, and sand which form the ancient cone. They project in relicf several inches, or sometimes feet, from the face of the chiff, being ('xtremely compract, and less destructible than the intersected tuffis and porous lavas. In vertical cxtent they vary from a few yards to $r 00$ feet, and breadth from one to 12 feet. Many of them cut all the inclined beds in the escarpment from top $t_{0}$ bottom, others stop short before they ascend alove half-way, and a few tominate at both ends, either in a point or ahruitly. In mineral composition, they scarecly lifter from the lavas of Somma. Their texture is dilferent at the edges and in the middle: toward the centre, the rock is larger grained, whil" at the edge it is always liner grained. sometimes
conline, it being known that matom trap ar lava, when sublenly couled, assumes a vitresplas otru-tur". while a show combing, is it jermits the mases to remam in at combition ditent for the operation of the crystalline force, and the: sompation of the semarate materials, probluecs a mom on lase grambarstructur,
 rock forminer the lykis i.s for more compact than that of ordinary lava, for the jurusme of a chlum of melted matter in a fissare geratly oxecels that in
 expansion of those grases which furn wesioles in lawa. What the fissures have leeen "penines for the egress of molten matter, the surfaces haw been warn :mal sumothed by the current, the intonse heat havines methen all juojections amd intetrontions to the lassage of the ineambersent fluil.

The apporances of auciont tapertyen are wry similiar to those of recent volemic dykes. Trape dylses gencrally are pominent oljects in the linn scape, becanse, white the sufter rocks throngl which they have intruded have loen abraded ly the so. rivers, ur ran, they, bine mure compact, stam mit. frominently in the face of precinicess or on the level surface of is conntry. simmetimes, however, from chemical action, ami chatly from the oxikation of the irom which all trauruoks cuntain to a grater or less axtont, the intrudel dyke dueompuses mone rapinlly than the containing rinck. It then fur some fect or yarels leaves the oriminal disure argan mooocupicd. A simmar momitication of this arramement way sumetinus be noticel, when the intrulert ignewns rock has so indurated the beds thranch which it passed as to make them less lialle to Weather than the unaltered portions of the beets, or than even the lyke itself. In such cases, we timi two parallol walls of indurated stratar rising above the rencral level of the country, and foming the banlis of a ditel produced by the disappearance of so much of the dyke. All thes appearances may be ohserved in the intant uf Arran. it locality marlassed for observing those remarkable genowical phenomena. Some dykes have had no aplarent intluence on the adjoining strata, even when these consist of materials most lialife to be affected by heat. Thus scams of coal sometimes remain maltered, thonsh in ountact with the supposed injected multen matter. Consilerable dulat is thus cast upon the generally receiverl opinion. that in all cases dykes were intrusions of lava. The effect; that have been produced in wumerons instances can, bowever, only be accunted for by sumpoing that the arjacent rocks have heen affected ly heat. Tho writer has whserved in Arran, at a place where a lyke cut at right angles an ohler one that the edl:" of the ohbr dyke, which had been acted upon les the current of liquid lava, were converted into trio whidian to the depth of nearly hate on inch. In Anglesta, shale at the enge of a dyke 134 feet wille has been conserted into hard percellamoms jasper; and argillacons limestone loses its earthy texture, and becones granular and crystalline. The chalk, in Antrin, is converted, ly lasaltic dykes, ints gramular marlle. Coal, as might have been expectel, is uften alterel in an extraordimary degree. Witham describes the effects of the Cinckiell Fell rlye on a seam of coal throngh which it passes. It is a nearly vertical wall of trap, 18 or 20 yards thick, and is traceable to a distance of 70 miles rumber in a south-east direction. The enal is abont 6 or 8 feet thick, and is atfected ahmit 5 yards frum the dyke. It first loses the ealeareous sjar, which vecurs in the joints and faces, begins to luok dull, and loses its quality for burning. As it comes nearer, it assumes the appearance of a half-hurnt comder ; and approaching still nearer the alyke, it grows leas
and less in thickness, becoming a pretty hard cinder maly twe ieet and a half in thickuess. Eight yarels furthor, it is converte l intor real cinder; and more immertiately in contact with the dyke, it becomes a hack sulistance resomblins soot cakel tigether, the seam ling reduced to mine inchers in thickness. The eosal thens deterionatol is 2.5 yards of had shomt comal. half reduced $t$ comer; 16 yards of cinder ; and 10 of sonty sulistance.

DYNACTINOMETER, an instrmment emphoyed for measuring the actinic fore of light, and fur compraring the degres of rapidity with which photographic lenses act. It is ton complex in use, and too expensive, to a lmit of being senemally adonted. Fir a detailed deseription, the reader is riferved to Junt's Photogrephy.
DYNA'MIC'S is that division of Menhanies (q.v.) which contains the doctrine of the motion of lumies pronnced by forees. It is essentially a science of Aleduction from the laws of mation (see Mutios, L.sws (op), umder which head will also be fomm a hrief sketch of the growth of the scimace. The brames of dymanics cianble of being treatal in the present work will lo found discossed monder separate heals. We shall here enntine ourselves to giving a riew of the main branches and their currelation. I. The tirst branch of dynamics deals with the fundamental emecp,tions of the scionce, their names and detinitions. such as relucity ( $\mathrm{c}_{\mathrm{p}}$. r ) and the different linits of mation (I. W.), and acceleratul motion (If w. ; force, accolentiog fores, and movine fores (see Fone'E). Cnder this hrmeh also fatle the compo-
 Norross). 11. The steond main brawh of dymanies treats of the motion, free or constrained, of points. Here two prohnms are solved in each case-i. e., whether the motion he free or constrannel-viz, a lirect and an inverse problem; as, for example: $\mathbf{1}$. Ton letermine the fath of a point when the fores are given which act um it: $\because$. To hetermine the foreus on force acting on a luint when its path is given. This division of dyamical problems into direct and inverse, olstains in all the franches. It may be mentionel that it was by shaing the inverse prolilem that Newton and Iluwens effected their greatest florives in comncetion with dynamiss. The methot of treating the case of a free point now generally pmphyal, is the to calor. She, under this head, Cexphal Forefs: finlisg Bodies, and Thonectiles. Ill. The third main lranch of dyumies is concerned with the motion of a rigid system of puints, or of a mblil buxy. Few of the sul-tranches of this part of dynamics are eapalle of exposition in this work,
 thtion, (diatef of Percission, and Pexim, The honour belongs to w'Alembert of estaldishing a ereneral methot of treating prohlems in rigit dyumics. Jrevimus to his time, earla set of such problems was trated on some principle peculiarly apploable to itschi. D) Alembert mvented an (wheh goes by his name) applicalde to all such hions liscours. 1 V . Thu fourth main lranch of dyumics is conerned with motions of ratation. A systom of ricid pints may be suljowt to two indopmondent kinds of motion. It may suffer a montion "f tromslation in spactere a motion of rofation aboult some foint or alas within itsolf, or it may Fanler at umo is motion of translation and a rotatery nuetion. These may dearly lu treated conjunety
 imblomantly, ly investatimg. I The selocity and Whetion of the entre of gravity of the system: and, $\underset{\sim 2}{\because 2}$ The direction at each instant of the spon-
tameons axis of rotation passing through the centre of gravity (see lootstion), and the velocity of the rotition of the systrm round that axis. fo effect the second task. Poinsut propused his theory of Comples ( $1 .$, ) Semal general theorems in dynamics, not alove mentirned, will lo fornd disenssed moler various heads, to which the reader is now referred. Fror tha fonsereation of ar-as see Cestral Forecs. For the conservation of living forces (ririun rivarum), and the principle of least action, see Foncrs. Sce also Mhmexts of Ineritha, and lmpact.
1SHART, a royal parliamentary and municipal burgh and seaport in the south of Fifeshire, on the rocky shore of the Virth of Forth, 12 miles north-north-east of Edinburgh. It chietly cousists of three streets, with a small square. La the High Street are many antique lumses, with inseriptinns and dates. It bas ship-building, flax-spinning, and manfactures of clamasks and ticks. In the vicinity are coal aml ironstome mines. Pop (1861) 8067 . It mites with Kirkcaldy, Burntisland, and Kinghom, in semlin: a member to parliament.

DYKCRA'S1A (fr. dys, diffeult, and kretsix, a mixture), a pathological term much used in fiermany by celtain authorities, to indicate an altered cmultion of the boorl and fluids of the system, lealiner to constitutional diseases, as iropsy, cancer. delirinn tremens, laat-pistaing, \&c. See Chchexin and Inituesis.
DYSENTERY (Cr, dym, lifficult, and enteron, the intestine), in form of disease attended ly discharges from the lowels, ant lifiering from liarthen (q. v.) chiefly in leing attomed by maked fever and pain, as also liy the presemee of howd and intlammatory prolucts in the discharges. Dysentery is, in fact, is disease of the muens membrane of the (colon (4. \%) or ercat intestine, and when severe, it is followed by the destruetion of that mueons membrane to a great extent, the intestine beomung much enomacteal at intervals, especially in its lower part, and the evacuations being therefore apt to be retained, especially the solid lirtions. The most distinctive symptoms are excossive pan in evacuating the bowels, amd fregnent ineffectual attempts at evacuation (tenesmas), tenderness on pressure in the left side of the ablomen, discharges of howl mixed with mucns, and comparatively little fueal matter ; these symp toms heing accombanied or followed ly intense firer, passines into early depression of streusth. lysentery is a disease of extreme danger in many cases, anit should always the placed early under medien treatment. The lest domestic plan, whem modical advice camont le at once procured, is to give a mondrate dose of caster mil, gramed ly cithey "r thirty drops of landanm, and then hour on oner's power in ter-grain doses avery sure us two or ipecachana wine in two ar thre arh tenspontul doses at simiar intervals, owh with ton in twenty drops of landaum, aceord. Hef the "flecet on the system. If romiting is repeatedly problued, the dise of ipecacuanha wine the lu be lessemel. If the gran and irritation of siven ly are extreme, the "pimm hal better be starch after small injoetion (see enster) with by a larger warnw dow enjontion: and it will well tor repat the simple warm-water injoction en interwals thmolumt the treatment. Desentery, in its menst surw forms is emmmaly a disease of the troperal 2 ons. It is ofton formed in connection with intlammation of the liver.

 with hydrochlorice acid for some time. It is a
nentral resimens bulde, which is dillienttly soluble in naphtha, tumpentine, and other conmon solvents.

DV'soDIf, a yollow or arayish laminated hitaminous mineral, oitous fomel with limite. It hurns vividly, and ditheses an oulour of assatictida.
 (digestion), at emontife term for Indigestion (!.v.).
 beathing), a word the manines of which is sufficimtly indicatal by its etymongy. Sece Astums; Resithation; lunge, loshatise of, \&e.

DYSU'JSA (Gr, dys, dillicult, and ouros, mine), a difliculty of passing urine. It maty depend on a varicty of causes, as restards which, ace lilabuer; ambluethia, Disedises of.
 gemes of algatic collopterms insects or waterPeetles, now forming the trabe of family hytiscicte. Jhey are pentumerons colenptera: that is, lave atl the terse dive-junted. Their ermeral form is wall, the ontline little broken, ant the surface wery smonth. The respiratory wrems of the perfect insect are not alapited to the cxtraction of air from watro, and it must accasimally come to the surface to breathe, whore it rests for a short time back downwarl, and with the extremity of the alobemen exposel to the air, the opeming of the air-tules being in the last segment. The Pytiscite are

A, Igtisens Marginalis, of great Water-brette; 12, Jarva.
excessively voracinas, feeding nom any kimd of animal foon, ami lowhly attioking creatioces larser than themselves. They are wory amusing inmates of the fresh-water anduarimm, and sometines live in it fur a year or two, getting tame, and reatily coming to le fed with small earthworms. bits of beef, \&e. The species are mmerms, and vary much in size, some being very small, and some almust two inches in length. A very common liritish spucies is 1 . margmeli,s, alrout in inch and a puarter in length, of a dark olive colour, the thorax and outer sides of the elytra margined with yellow. All the species are found in lakes, ditches, marshos, and the still parts of rivers. They often leave the water ly night, ant can tly well. Their larve lane the haly long and tapering. composed of cleven rings or segments, lesides the heat. They hide themselves in the carth, in chamers which they make for themselves, before changing into pura.

## DZIGGETIIAI.

IGIGGETHAI, DJIGGETAI,KİNG, K If L R, or GOOR (Equus Ifemionus), is quadruped nearly allied to the ass, and believed to be the hemmomus of Herodotus and Pliny. Siee Ass. It inhalits the elevated stepres of Tartary, extending futo the sonth of Siberia and to the borders of India. In appearance and characters, it is intermerliate hetween the horse and the ass, whence the ancient Greek name hemionas (half-ass). In size it aproaches the horse, which it resembles also in gracefulness of action, and in its neighing, which is twen more deep and sonorons. Its general shape is 726
much like that of a male. The $\mathbf{I}$. lives in smatl herls, sometimes of several males and several females, sometimes of a single male with alout twenty females and forals. It is an animal of great fleetness and shyness, or watchfulness, and pussesses also great powers of endmance in flight, so that it is with diffeulty killed liy the hunter. The Mongels and Tunguse, however, hunt it very eagery on aceonnt of its flesl. It lias becon donnesticated and reduced to the service of man, but there does not seem to be any evidence of its ever breedino in a state of domestication.

## E

'ILEE fifth letter in the (irecoIRoman alphaidects. its original amd fundamental somm is that heard in Eing. tent. 'The somm hearl in me is nat given to it in any languare lont English. Ia the scrices of sowels it stands intermediate between $i$ and 1 . Sue Letties and Aericulate Souvis, where the varims rowel-someds represented hy the character $e$ in English will le noticert.
$\mathbf{E}$, in Wusic, is the third note on somin $x^{\prime \prime}$ of the matural diatonic seale, and is a third above the tonic $C$, to which it stands in propurtion as 5 to 4. As a major third, that is, when the tonic C vibrates 4 times, the $\mathbf{E}$ alove vibrates 5 times. E is the third harmonic which arises naturally from C as a fundamental note. E major, as a key, has four sharps at its simature, viz., $\mathrm{F}, \mathrm{C}, \mathrm{G}$, and D sharp. E minur, as a hey, has unly one sharp, F, same as Ci major, of which bo is the relative minor.
EADMER OF CANTERIBURY, a man of consilurable mark in the bexinuing of the 1 the $c$, would seem, from his name, to hase heon the chitd of Enolish parents. At in carly aree, be entered the ]nedictine monastery of Cauterlinry; and when St Auselm, in 1093, was mate whbislon, of that sce, E. becane one of his most dewoted frimels, sharing his exile, watching his death-bed, ordering his hamial, and writing the chronicle of his life. E. contimul at C'unterbury, in high esteem with St Anselm's successor, Archlishop lialnh, until 1120, when, at the request of King Alexamer 1., he went to contlam, and was there chosen Rishop of st Audrews. The rustion of lay investiture of eedesiastical henelices was then in its erisis ; there was a controversy between Canterbuy and York for jurisdiction wer the see of St Andrews; that see, again, asserted its independence of either of the Euglish metropolitans; and E. scems to have allded to all these perplexities a liftieuty as to lis momastic allegiance. "Not hur all Scotland,' he said to the Soottish king, 'will I renounce being a monk of Canterbury.' 'The kins, on his side, was equally unyiulting ; and the issue Was the return of E . to his Lurglish monastery, monscerated, indeed, hut still claming t" be Bishop, of St Andrews. He was ande pecentor of Conterbury, and died, it is supperied, in Jannary 1124. ITe tells us that, from his chilhoom, he was ar diligent observer of contemprary eventes, esper cially in church attitirs; and this hahit has given more than nsual interest to his writings. Th. most valuahle are his Mintorice Nomorm, or Wistomy of his Uwn'limes, first priutal by selden in lfors. and his litu Anselmi, on Life of N't Anschm, iorst putbished at Antwurp in 155 . Both thowe works are included in the selection of his writings published by the Benedictimes of sit Man (as a sujoble ment to their edition of the works of sit Anselm), in I vol. fol. (laris, 1721). His lives of St Odo, St

Dunstan, ami St Breawyn, of Cunterbury, and of St Wilfrid and st Uswald, if York, were priuterl, sime of them, hy Wharton, in thas second 1 art of his
 in lis Anselmi opro (l'ais, 10:5). Ille history uf E., in relation to the hishopric of st Andrews, is given at consiterable length ly Lord Hailes, in his Amals of Siotlond, vol. is ph. 59 51 ; and, still lectter, in Mr Grulbs Écelesiastiont Mistory of scoblaml, wal. i. ] 7 . $200-217$ (Litin. IS61).

EA'(iLE (1quilu), a senus of birds of prey, ly some naturalists subsivnded intu suveral genera, constituting a group, which contains the largest and must powerful of the Fitionidu?. From the aunt ancient times, the $\mathbf{E}$. hats been miversally repardud as the emblem of minht and courage; and, like the linu, it lass ber fancifully invester with other attrilutes of greatness, such as men thonght to harmonise with these. Its extramblinary powers of vision, the vait height tow whel it some in the sky, the wild gradeur of the socnery mamst which it chitely lases (0) make its alode, mul ${ }^{\text {perhaps also }}$ its longerits. lave comemperi to recommemi it to petic regat. It was associated with Jupiter in the Jiman mythology ; its figure on the stamerds of the liomian legions expressel and anmated their contidence of victory (sec under).

The cagles have the beak not curver irom the Yery base, like the true falcons, nor mutched on the chre, neither are their wius so long in prometion ta thair size. Tleir wines are howery. very broal and expansive; their leys are very monst their claws curvol, sharp, ame stroug. Surmat muscles are described as pasing from (umpart of the aurble to another, but they are so little hovelonel in man that the $y$ du not jepnire nutice; there are adlitionally thre
muscles-the attollens awrem (or supcrior auris), the athohons curem (or cuterior auris), and the retrultens ourom (or posterior auris), which pass from adjacent parts of the scalp to the ear, and which, though more developed than the previous group, are of little or no real importance in man (at least in his eivilised state), but are of consideralble use in many mammals. Their actions are sufficieutly inlicated by their names.

The auditory canal passes from the comelia inwards, and a little forwards, for rather more than an inch. It is uarrower at the middle than at cither extremity : and on this accomet there is ofter censiderable difienlty in extracting foreign boolies that have been inserted into it. The nominme of the tympanmm which terminates it is placed mbinacly, in consernence of the dower surface of the moatus being longer than the upler. The canal is partly' cartilaginous and partly osseous; the osseons puntion consisting in the foxtus of a rinus of bone, aeruss which the membrane is stretched, anol in many animals remaining persistently as a seprate bone. The wrifice of the meatus is concealed hy a pointerl process, which projects from the facial direction over it like a ralve, and which is ealled the tratms, mobahly from being sometimes covered with histly hair like that of a goat (toryos) : and it is further tetender by an abuidance of ecrmminuns ghads, which fomish an alluesive yellow, and litter scoretion (see C'Lromes), which entaugles small insects, particles of dust, and other small foreign borlies, and presents their further passage into the meatus.

The mitcle cas, or carity of the limmonamon, is a space filled with air which fo recered from the I'harynx ( $\mathrm{I} . \mathrm{V}_{\mathrm{H}}$ ) throngh the Eastachian tabe (see fies. $1, b, c)$, and traversed by a chain of vory small morable lones (fig. -2), whith eomect the membianc of the tympanum with the internal ear. It lies, as its name implies, between the extemal meatus and the labyrinth or iuternal ear, and opens posteriorly into the cells contained in the mastoil portion of the Temporal Bone, which are also filled with air, aml anteriorly into the Enstachian tuhe. The uavity is of an irregular shape, and is tined by a vary doh cato ciliaterl epithelimm, which is a prolonmation of that of the pharynx through the Eustachian tule.

Its external wall is mainly fomed hy the memlrane of the tympanmo, which is nomely wal, and phased in a direction slantiner inwarks, so as to form an angle of about $45^{\circ}$ with the flome of the ambatmy camal (see tige l). The handle of the matlens (a) frimmer), the first of the chain of assicles (sed lig. $\because$ ), i.s firmly attached to the inner sime of this memhrane in a vertieal direction as far downwaris as the centre, and by drawing it inwards, remulers its external surface coneave.

Its internat wall has two openinge communicatins with the internal ear, each of which is closed by it - loluate nombrane. These oproings are termed, from their respective shapes, the foustre orulis, thel the finestre rotunda: the former leans to the vestiboule, and is comected hy its membrane with the base of the stapes (or stirmp-bunc), the last of the chain of ussicles; while the latter upens into the comblea.

The ussicles of the tympamu are three-viz, the mullors, the incers (or anvil), and the stapmes We
 with the numbrane of the tympanmm by means of its hatnolle. 'I'hrongh this commetion, the temsion of that membrane may loc modilied by tha arsency of ons or two mosehes which are attached to this asciolo. 'Jhase museles are the forator tympuni, whele arises from the spinoms procesg of the hplenond finus (If v.), and is inserted intu the processus gructis: ant the T'cnoor tymponi, which arises from
the under surface of the petrous portion of the temporal bone, and is inserted into the handle of the mallens immediately below the commencoment of the processucs aracilis. The existence of the former of these museles is doubtful, many anatomists regarding

lig. 2.
Ossietes of the left ear, as seen from the ontside and belon:
$m$, head of the mallens; $g$. the slender process, or processus gracihs: $h$, the manubrum or handle; sc, the short crus, and lo the long orus of the incas; $a$, the fosition of the lenticular process, through the medium of which it articulates with the head of the stapes; $s$, the base of the stapes. Magnified three diancters.
the structure in question as ligamentous rather than muscular. The mode in which this bone articulates with the incus is sufficiently explained by the figure, The incus much more closely resembles a molar tonth with two fangs, than the anvil from which it lerives its name. Of the two processes which it gives off (see fig. 2), the short one, sc, runs backwions, and projects into the mastoid cells behiud the tympanie eavity; while the long one, $l c$, inclines downwards, and termimates in the lenticular or orbicular process, $a$, to which the head of the stapes is attruched. The stupors is almost sufficiently described by the figwe. It bas a head, neck, two branches, amb ab base, whieln, as has been already montioned, tits into the fenestra ovalis. A minute musele, the steprolius, takes its origin from a hollow conical aminence termed the pyramal. which lies bebind the fenestra orulis, and is inserted into the neck of the stapes: hy pulling the neck lackwards, it IMolsbly compresses the contents of the vestibule.

The Enstachian tube, into which the tympanic cavity opens anteriorly, is about an inch and a half in luth, and passes downwaris, forwards, and inwards to its opeming in the pharynx. It is partly lonsy, lont chiefly eartilaginons. Its use is to allow the free prassige of air in and ont of the tympanm, and to intmit of the egress of the muens secreted in that carity.

Thee internat arr or labyrinth is the essential bart of the grgan of learing. being the portion to which the ultimate filaments of the Auditory Nerve ( 1 . v.) are distributed. It is composed of three patio-viz., the qustibule, the semicirculier canals, and the cochlea, which form a series of cavities presonting a very complicated arrangement, and Jyinf imbediled in the havlest part of the petrons furtion of the timporal bore. They commmente exkumally with the tympanmm by the two openines alremir doseribed-the fomestre oralis, and the fomstrit rotunch : and internally with the intermal anhitory eamal, which conveys the auditory nerve from the cranial eavity to the internal ear. The vory dense bone immediately bominne these eavities is termed the ossenos labyminth, (.) distinguisle it tron the mombronous lebyrinth, which lies within at ["+rtion of it.
'The mathmle is a common central cavity into which the semicirendar eanals and the cochlea open

Magnified ${ }^{3}$ diameter:.
the semiciretdar canals, one of the orifies beines common to two of the eanals. Anterionly, the coeblea enters it by a single opening, the begiminir of the secele vestiouli. On its onter wall is the fenestra ovalis, and on its imner are the forite hemisphroire, containing several minute oritices for the entrance of filaments of the anditory nerve, and the fovea semi-clliptica.

The semicircular camuls are three in number, and pren at both ends into the restibule. They vary in length, and notwithstanding their name, each is considerably more than a semicircle, the superior vertical canal being the longest. Their arerage diameter is about a twentieth of an inch, the extromity of each camal exhibitine a dilatation on ampmla. Each caual hes in a different plane, very nearly at right angles to the planes of the other two, homee them names of the superior aertical, the iuf"rior wertical, and the horizontal canals.
'The cochleu, which derives its name from its rescmblance to a common snail-shell, forms the anterior portion of the labyrinth. It consists of an usseons and gradually tapering canal, about an inclu and a half in length, which makes two thons and a lialf spirally around a central axis, termed the modiolus, which is perforated at its lase for the contrance of the filuments of the cochlear jurtion of the anditory nerve. This spiral canal is about onetenth of an inch at its commencement, and sratually diminishes towards the apex of the cochlea, At its base, it presents two important openings, one intu the vestibule, ant the other (elosed by a membrame exeept in the dry bone), and communicating with the tympantun, being the fonestra rothonde ahrauly described. Its interior is subdivided into two passages (scalu) by an osseo-membranons lamant, extending from the modiohs to the periphery, and taking the same spriml course as the canal itself. This is the lamina spiralis, which divides the eochtea into an upper passage, the scala vestibuli, and a lower one, the sacala tympami. At the apex, these two passares commumicate hy an opening to which the term haticotreme has lrecn applied. For a notice ul the meminamons portion of the laminu syivalis, we

sh, supcrine semicircular canal, with the ampulia and lts nerve at one end, and the other ent joined by 1 , tho moterior eanal, to form it emmon tube; $i$, infering or horizontal canal, witl the impulla and its berre at one conl, and the other entering the utriculus separately; $r$, fumbery otolith seen through the trmament wail of the utriculus or common sinus; $s$, powiery utulith if tha sacenha, seen with its nerve in a smilar way; n, coxhlear
 or facial nerse, leaving the athltary nerte, or portw molles, to cuter the alueduct of lallophus. "Magnified
consists of two sacs, an upper and larger one, of an oval shape, termed the utriculus, or common simus, and a lower and smaller one of a mone globudar shape, eallel the suculus.
'The membranous semiencular canals resembke in form and arrangement the ossenus eanals wheh enclose them, but are only one-thind of the diameter of the lattor. The ultimate filaments of the Auditory Nerve ( 1, v.) mainly go (see fig. 4) to the utriculus, to the saceulus, and to the ampulla of the camals,

The membanmes labyinth is filled loy a thad which is termed the emdolymph: and in certain spota, especially at the terminations of the rustibular norves, we oliserve, both in man aml the lower anmals, ealcarcons matter cither in a powitered or solind form. In man and mammals gencrally, amd in hirds and repitiles, it occurs as a powier and is temed otocome or car-poucder, and it always consists of carhonate of lime.

We now proced to consider the different functions or ufliees of the various parts of the urgan of hearing.

1. If the Exxternal Eur--A true auricle only exists in the mammalia, and in this elass it varies from lithle more than an inegnlarly shaped cartilaginums dise, with little or no motion, as in man anil the gualrumana, to an clonated fummeloshaper carr trampet, movale in all directions by mumermes laree museles, as in the horse, the ass, and the lut.

## EAR.

The monle in which we see it employed by those animals in which it is highly develoned, sufficiontly inslicates that its matin function is to collect and ennemtrate the sounds which fall unn it lint the experimental investigations of Savart, with an apmatus constrncted to rescmble the tympaic membane and the extemal anditory apmatus, shew that these parts are also maped to mator into viluations in mison with those of the arir; and he sumersted that the human amicle, by the varions directions of different parts of its surface, coulat always present to the air a certain mumber of parts whose direction is at rightangles with that of the molecular movement of that fluis, and therefore is the most favourable position for entering inter vibrations with it.
 experiments shew that the membrane of the tyan pranm is thrown intu vibration lo the air, amd that it always executes vibrations equal in humber to thuse of the sonomas lively which axcites the oscillations in the air. He further aseertained that the mallens participates in the oscillations of the tympanc membanc, and that these vilmations are propagated to the incus and stapes, anl thens to the membina of the fenestra ovals. The malleus has further the office of regnlatios, through the temem tympuni muscle, the tension of the tympanic mennbrane; and to allow of the motion necessary for this purpose, we finl movable joints hetween it and the incus, and again betwern the latter bune and the stapes. The contraction of the stapedius musche similarly monlities the tension of the membrane of the femstree woth ; and as cumpression exercisen on this mombrane extems to the perilymph. am! is propagatent thengh it to the finaster rotumetu, the tenam of the membane of the lattor upening is also intluanced by the muscle in question. The incus is much more limited in its nowtons than cither of the wher hones. and its use secms to be to complete the chain of ossicles in sucin a manner as to prevent any smblen of vioknt temsion of the membranes, such as we can easily conceive minht wom, if the comblactor betwen the mombranes ware a single bone. 'The presence of air in the tyomanic cavity scrves a comble purpmes ; in the first place, it preScrees a mifmem temprature on the onter surfaces of the fenestral montmanes, and thas suphots a dixal elasticity in them, which womh with the the cane if they wore fremy $x$ [used to madinary atmas pheric changes; aml socmully, the retion of the chain of ussicles as combuctors of sound is materially increased hy their luins completely surammber by air, as is obvions from the first 1 minciples of acoustics.
3. Wi the Lathrinth.-. Soumil is comblecend to tha babrinth in three ways: tirst, ly the dam of Innes; secomilly, by the air in the tympanic catvity: and thirilly, through the lomes of the heal.

" hat the bestupule is the issuntial or fumbimmental part of the omen of heorine is sulficiently praven

as we descem the aninal seale, and by its matral lusition in the ears of the higher animals. The nise of the oteromia or ear-powler is to streagthen the sonorns molalations, aud to communcate to the membranons vesthmber and ampullie, and to their nerves, strouger inpulses than the prilymph alone comld impart. The action of otoliths or car-stones, such ats vecur in osseous fishes, must be still more deciled, and is well illustrated by the following experiment of Camper. Fill a bladier with water, and pace a prebble in it. The slightest impulse communcated to the bladder disturbs the pebble, whicle consequently produces a greater impression on the hame supporting the bladder than the water alone crimhd do.

Nothing cortain is known regardine the functions of the semicireular camals, but their constant existence and mumber* in the vertelrated animals imlicate their importance ; and in most cases of congenital ileafness they are more or less defective. The fact of their position corresponding with the three dimensions of a cube-namely, its length, hreadth, and height-has led to the opinion that they are concerned in conveying a knowledge of the direction of somds. This view is sumported hy lrofersor Wheatatone, who beheves that we distinguish lust the direction of those someds which are sutiociently intense to affect the bones of the head, and that it is from the vibrations which are transmittel throngh these hones that our perception of direction is coltamel. Thas, if the soume be transmitted in the plane of any one canal, the nervous matter in that camal will be more strongly acted on than in either of the other two : or if it be transmitted in a plane intermediate between the flanes of this canal and the adjacent one, the relative intensity with which these two canals will le affected will depend upon, and indicate the direction of the intermediate plane.

The runge of hearing, like that of vision, varies remakally in lifierent persons. Some persms are iuscnsible to sounds which others can readity hear. The ortinary range of homan hearing comprised between the lowest notes of the organ and the highest known samel emitted by insects includes, acerrliner to Wollaston, more than mine octaves, thl. while of which are distinctly perceptible by mest ears. He rolates. howerer, sereral cases in which the range, in reference to the jerecption of high motes, was much less. In one individual, the sense of hearing terminated at a note fun octaves aime the midile E of the pianoforte, the $F$ above it hoing inaudible, although his hearing in other rosects was as prucet as that of persons in gencral ; aminno case was that of a laly who conll never hare tho chirping of the diedd-cricket: and in a thurd case the chiping of the conmom house-sparrow

Tha sensation of sombl, like that of light, freguently lasta longer than the exciting canse. We have faniliar profof of this fact in the mose which rombins in the cars after a lowe jouncy in a conch (1) malway; and it was charly demonstrater by Suat. Who fomm, in his experiments on tomethed wherls, that the remowal of one tiwoth did nat frolue any interpuption of the sommi.

EARL's PENNY, an English corruption for Arles Penny. See Eifinest.
EA'RLSTON, or ElictLDOUNF, a village in the south-west of Berwickshire, on the Luader, a north branch of the Tweed, 30 miles west-southwest of ferwick. Pop. ( 1861 ) $18: 29$. E. has heen and stall is famed for its manfacture of finemms; it has also a factory for the mamuacture of blankets, tweeds, \&e. On the left batk of the Leader are the ruins of a buiding ealled 'Thymer's Tower,' as having been the resilence of Thomas the Rhymer ( $\mathrm{q} \cdot \mathrm{r}$ :) : so fanous in scottish tradition. I mile south of E. is Cowdenknowes, which is celeldated in song fur its 'hemuy, bonny brom.'
EARLY ENGLISIL, the term generally applical to the form of Gathie in which the pointed arch was first employed in this country. The carly English suceceled the Noman towards the end of the $12 t h$ c. and merged into the Decorated ( $\mathrm{r} \cdot \mathrm{r}$ ) at the eni of the li3th. Its characteristics are bantiful and peenliar. Jietaining moch of the strength and sulidity of the earlier style, it exhibited the sacefnl forms, without the relundancy of "rnament Which latterly degenerated into a fault in that which frollowed. Generally, it may be said to bear to the deconated something like the relation which an expanding rosebud bears to a full-hlown rose. The winhows are long and narrw, and when gathered into a group, are irequently surmounted hy a large arch, which springs from the extreme monlding of the winduw on each sid. The space between this arch and the tops of the winchors is often piereed with eireles, or with trefoils or cuatrefoils, which constituted the errliest form of tracery. Each window, however, is ancally destitute of any tracery in itself. "The montidurs,' says limker, 'in general consist of alternate romis aniz leeply-cut hollows, with a small almixture of fillets. produciug a strong effect of light and shalow.'... biluss. of Architacture From the same work we borron the acompanying illustration of two very beantiful piers, surmonated

Larly Eugish l'iers and Arch.
Dy a lancet-shapel areh, and decoratel in the manner fucoliar to the style. They are from Whestminstor Thby. Gircular whluws, how eres, still contimed tw in "asel, aml trifoliated archwas over choors are
also to he found, as at Salisbury Cathedral. Py far the most characteristic feature of the style is the Tonth-ornament (q. r ), which is often used in great profusion. Where folinge is used, it is cut with great boldness, so as to throw deep shadows, am pronluce a very fine effect. The under-cutting is often so deep as to leave mothing to connect the leases with the mouldinge but the stalks, anul gecasimally the edge or point of a leaf. The tem Early Enflish is said, ly Parker, to have been introntuced by Mr Millers in 1805 . It corresponds to Opirule primitice of French writers, and is pery often lnown as the first pointed or lancet-archel amongst ourselyes. See Gothe Anchitecturl.

EATN, a river and loch in the sonth of Perthshive, in the dinely-womled, beantifnl valley of Strathearn. Luch E. lies to the morth of Ben Vourlich; its eastern extremity is 24 miles west of Perth. It is 7 miles long from east to west, 1 mile broul, and 100 fathoms decp, ant is surrommed by bold and rugged hills. The river E. flows east from the loch 40 miles throwh the strath, ${ }^{\text {nist }}$ Comrie, Crieff, and Bridge of Earm, into the estnary of the T'ay, 7 miles south-east of Serth. Nloug the river, near Abernethy, muder a thick hed of clay, is a peat-hod 2 or 3 feet thick, surposell to le a contimuation of the submarine forest at Flisk.-The Bridge of Farn a much frequentext village, stands on the right hank of the river, 6 miles sonth-south-west of l'erth, anel near the saline springs of l'itcaithly.

PARNEST, or AlRLEA, as it is called in Sentland, from the civil law wod aroce, is a small sum of money which is given, or a simple ceremony, such as shaking hands, which is performed in prooí uf the existence of that mutual consent which constitutes a contract. In the first case, the earnest is sail to be pecuniary ; in the second, symbolical. It is not the carmst, but the consent, i. e., the ayrement to a certain price, that is the root of the bargian; and the carnest thus becomes a mere adminicle of evidence, which may be dispensed with even in eases in which it is exacted by custom, if the parties choose to prescrve other evilence of the completion of their hargain. The contracts in which earnest has been most frequently given both in this comatry and elsewhere, are sale and service. In the case of sale, it usually consists of a small sum paid by the luyer. by the acceptance of which the seller is held to limed himself to the sale; in the case of service, it is a small snm given by the master, in aceepting which the servant becomes bound to serve. The question as to whether the earnest shall count as part of the price or wage depends on the intention of the parties, which, in the absence of direct evidence, will he inferrel from the proportion which it lears to the whole sum. 'If a shilline he given, as Mr Erskine says. 'in the purchase of a ship or of a box of rianmens, it is presumed to he siven merely in evirence of the burcain, or, in the common way of speaking, is deal carnest; hat if the sum be bure considerable it is reeknund up in the price.'-Inatitutes, b. iii. tit. iii. s. 5 . 'I'lue uriginal view of earuest in Eneland was, that it was a pryment of a shall portion of the price or ware, in token of the com. clusion of the contract (Siny on Soles, 13. 216) ; and as this view seme to hatw lwen adhered to, the sum, howeror small, would porbably there be comoted as a part payment. There is only one decision moder tho 17 th section of the stathtio of Frames (e9 Ch. 11. c. :3), which providus that 'no eontract for the salu of any forels, wares, and merchandises, for the price of $\dot{\alpha} 10$ sterling, or upwats, shall be allowed to be kowl, wacept the buycr shall aceept part of therombsonson! ; and actually reecive the same, or give something in carnest to lind the bargain, or in

[^2]part payment.' 'The cons reformit to "mated to tho
 a shiming fom his proket, aml drow it aerose tha Hand of tho sollopes servant, and then rethmed it to his own pocket; and it wiss lolel that this ant (which is a enstom in the Nomble of Dochlenkl, and is called striking a howain) wats mot sumberont tot satisfy the rafuisitions of the stalutn: Story, ul sup. From this decision it follows that no impnatanere is attached in Fangland to such thetitions cerommentes ins the Jew fheking ofl his show nnd givine it to

FADRLING. A rims suspumed from the car which is bored for the prapose. This morle of atorning the person has always emjoym mont favour amongst Oquentils. Jiy lersiaus, Babyloniaus, Lydians, Libyans, and Carthaginians, cirrrings were worn by both sexus. la the clatsijual rations of antiquity, their usi was confinent to
 sented as aloming herself with enrings mate with three drops rasembling mulberites. Irow this pericul down to the latest, the practice frevaiterl in Greece, and we liud the ears of the Vemas de Acdici pierced for the reception of earines. I liny says (xi. 50) that there was no part of dress m which greater expense was lavislued amonerst the lonnans; and śoneca nentions an tariner, of which a duwing, copied in our illostration (tig. I), is given in Smith's Dictionery, which he sirss wats wortl a pratrimony. It has fonr pearla, twor alnse and two below the pre

Ancicnt Earrings. cims stone in the centre. in the more valuable of the antigue carriness, pearls were almost always used: anm thay ware valuad for the completeness of their form as well as for thur whitenuss. In jlace of a ring, the ornament was often attacherl to the ear with a lookl (sce tig. 2), a custom which still prevails in Ttaly Many Firytian earrings of very beantiful derign have leeen preserved, of which fis : is an example. These antique desisns have been imitated in moderm times, and if the use of an ornament whieh seems titter for a Sontly Sica islander than an English gentlewoman is to he continued, it can scaredy assume a more graceful form than was often given to it by the ancients. See Nose-mive. During the reigns of Elizabeth and James 1., earrings were worn in England by men; a custom which is still continued by many sailors. Master Matthew, in Every Man in his Ifumoner, says to ErainWorm: "1 will pawn this jewel in my ear;" and 1lall, in his Satires (I. vi. Sat. 1), spealis of the 'ringed ear' of the new-come travelles ; aud many similar passages to the like effect might he quoted. At the present day in England, earrings are worn only liy women. The ears are lored usually at about seven years of age. The boring, which produces a temporary inflimmation, acts as a counterirritant in cases of sore efres, and this is sometines given as a reason for putting rings in the ears.

 'fhen by valumatime the ammant uf attramelion of

as the earth? 'This is easily answored, anel henee. as we know the attractive force of tho carth, we can! at once compare its mean density with that of load. Mr Baily's experiments lead to the result that the rartlis mean density is $5 \%$ tines that of watwr. (3.) A thimi mode has lately been ampoted hy Mr Diry, astronomer-royal, hy compurison of two in. variable pendulums, one at the "arth's surface, the wther at the loottom of a pit at Jarton ('olliery near Neweastle, 1200 fect low the shatee. The density uf the earth, as ascertancel by Ne Ary from thas experiment, is between 6 amd ${ }^{*}$ times that of water; lat for varions reasons this resnlt is not to be ascepited as against that of the ('avemdish experimont, and it is said that Mr Airy is himself dissatistied with it, and means to repeat the exjeriment with new precautions. 'J'he density of the earth bring known, its mass is easily caloulated, and made a mit of mass for measuring that of the other horlies in the system. It is fomme that the mass of the earth compared with that of the sun is 0000108173.
3. The Motions of the Ethoth.-The earth, as a momber of the solar sybtom, moves aloner with the uther planets round the sun from west to east. This is contrary to our sensible impressions, accordiner to which the sum soms to mose round the earth; and it was not fdd a few ecnturies agn that men were able to ret wer this illosion. See Copere Nufan sisten. This journey round the san is performed in about 30 days, which we call a year (solar vear). Thereath's path m ormit is not strictly a circle, but an elliuse of smail ecentricity, in one "f the foci of which is the sum. It follows that the parth is mot equally distant from the sun at all times of the year ; it is nearest, or in perihelion, at the berinning of the yenr or when the northern hemisphere has winter ; amd at its greatest distance, or aphelion, about the middle of the year, or during the summer of the northern hemisphere. I'he difference of distance, however, is comparatively tou small to exercise any perceptille intluence on the heat derived from the sum, and the variation of the seasons has a quite different eause. 'The least dis. tonce of the sum from the earth is over 94 millions of miles, and the greatest over 96 millinons ; the mean listance is commonly stated at 0.5 millions of miles. If the mean distance be taken as unity, then the greatest and least are respectively represented by lollog , and 098321 . It follows that the earth fearly deseribes a path of upwimls of 506 millions if miles, so that its velomity in its orbit is about 99, 100 feet, or la miles in a seconl.
besides its ammal motion romme the sun, the carth has a linily motion or rotation on its axis, or shortor diametre, which is performel from west to enst,
 of untan time. orn this motion depend the rising and setting of the sum, we the vieissitudes of hay and minht. The relative lomethe of day ame nisht 1) pewd upon the abule fomme by the earth's axis with the fllan of its orl, If the asis were perberndirular to the plane of the arbit, alay and night would he canal thanin the whobe year over all the rath, and there would ha whenge of seasmus; lut ther a xis masers with the whit an angle of $233^{\circ}$, and the conseducure of this is all that varioty of sepons aml of chmales that wo tind on the earth's surface ; for it is unly for a small strip (theoretieally, for a mere line tying umlar the mpator that the days and midhts arn eqpall all the vear at all other places, this rymatity moly omen on the two days in bach yoar when the smo serons tor piss thronel the ralastial mantor, i. c., abont the Elst

The velseity of the fartlis rotation on its axis cundently increases grablatly from the iow tos the equator, where it is alwat apmal th that of a mownetbaill, boing at the rate of $2 t, 510$ miles in day, or alnat 1441 feet in a seconns.
A dirvet prow of the rotatiom of the carth is
 are indubitable imbations that the earth was originally luid, or at lanst suft; ami in that cons dition it must have assmoll the phamial shape. 'The only canse, than, that cen be assigneal for the fact that it has not home sur, is its rotation om its axis. (aflenlation alkes Jows that the anmont of compression which tha virth astually has, entres pomls exactly to what its kimwn veluity ami mass must have problued. Lxperinents with the far dulum, ton, shew a decreasio of the force of gravity from the proles towards the equator; and thoneth is fart of this recrease is owinf to the want of perfiet sphericity, the greatest fart arise's from the centrifugal force causen by the mation of ratation. Another direct prof of the same bymothesiw may be dawn from the observation, that lambes drapmell from a consideralde height deviate towards the cast from the vertical lime. This fact has lown established by the experiments of lonzenberer and others. In former times. it was leclionel that of the earth actually revolved in the direction of ast, a stone drepped from the tha of a tower would fall, not exactly at the funt of the tower, hut to the wint of it. Now, as experience, it was archut, sluews that this is not the cas-- -that the stinne in fact, does fall at the lattom - we have hare a ponf that the pretended rotation of the earth does mot take place. Jern Tyelo Brahe aml Jiocioli hed this aljection to the doetrine to lee manswerable lint the facts of the casc were just the revorse. Newton, with his wontel cleamess of vision, saw that, in consequence of the eartli's motion from west to mast. bonlies slescenting from a height anst decline from the promendicular, not westward, lut eastwam ; since, ly their greater distance from the carth's contre, they acpuire at the top a serater eastwant velucity than the surface of the carth has at the botton, and retain that velocity dump their deseent. Hu therefore promosen that more exact observations should be made to ascertan the fact; lout it was not till more than a century aiterwards that experiments of sufficient delicaldy were male to bring out the expected result satisfictorily. It is diflicult to fiml an elevation sufficiently, great for the mannse, as several homdred feet givemerely at shat deviation, which it requires great accuracy to observe. If a heidht of 10,010 feet conllil be manle availathe, the deviation would be not less than $7 \frac{1}{2}$ fect. The analory of pur empth to the other plimets may als, be alduced, the rutation of which, with the excibution of the smallest and the most distant, is distinetly discemible. Finally, an alditimal proof of the eartis rotation was lately given hy Lem Fome:ult's striking experiment with the pemtumm. The principle of the expriment is this: that a pembulum once set in motion, and swinging frecly, eontinus to swing in the same flane, while at iny plate at a distance fron the equator the pane of the meridian contmues to change its pusition relative to this fixed plane.-The ubjection taken to the ductrue 151

## EARTH-NUT-EADTHQUAKE.

and uncemented stones, ronfed by whewn flass, and entered from near the top by a rude doorway, so low and narrow that only one man ean slide down throurh it at a time. When the chamber is unusually wille, the side-walls converge, one stone overlapping another, until the space at the top can be spanmed by stones of four or five fect in length. In its more alvancel form, the earth-house shews two or more chambers, communicating with one another by a narrow passage. There are instances in whiuh one of the chamiders has the circular shape and dume-roof to which archeologists have given the name of the 'Beenife-moese' (q. v.). Occasionally, as many as forty or fifty earth-houses are found in the same spot, as in the moor of Clova, not far from Kildrumny, in Aberdeenshire. They appear to have been almost invariably lmilt in dry places, sueh as gravelly knolls, steep banks of rivers, and hill-sides. They are generally so noar the surface of the gromnt, that the pough strikes upon the flagstones of the roof, and thus leads to their discovery. The object most frequently fonnd in them is a stone querm, on land-mill, not diflering from that which contimed to be nsed in remote corners of Seotland within the memory of living mea. Along with the quern are generally found ashes, bones, and deers' horns; and more rarely small round plates of stone or slate, earthen vessels, chis and implements of lone, stone celts, bronze sworls, gold rings, am the like. Occasionally, the surface of the gromm heside the earth-honse shews restipes of what are supposed to have been rude dwelline-houses, and folds or enclosures for cattle. This, with other things, wonld inlicate that the earth-houses of Scotiand anul Irelam (for they are found also in that isham) were put to the same murpose as the eaves which, as Tacitus (writing in the od e.) tolls us, the Cremans of his day dur in the earth, as storehonses for their com, and as plaees of retreat for themselves dhring winter, or in time of war.

EARTH-NUT, a popular name of the tubers of certain umbelliferous plants, lartienlarty Funium bulbocastanum and B. glernosmm, which are common m most parts of Europe. Names of the same sigmification are given to them in a number of Eurnean languages. Armut, Yermut, and Jumut, Seoteh and Enghish provincial names, are corrutions of carthnut. Pig-vur is another common English name, ligs behar very fond of these tubers, grubing up the gromid in quest of them, and soon becoming fat upon them. They are also called curth-chestmut, from their resemblance in taste and qualities to chestnuts, perthaps also from their resemblance in size, and their beins black or very dark brown externally, aml white within. By some they are preferred to chestunts, and they are much used for food in different parts of Europe, and oceasionally in some parts of Englanl, either roasted or in soups. They are whimesome and mutritions; they furm an article of trabe in Sweden, and have sometimes been recom. memped as worthy of an attention which they have never yet recuived in britain. The two species are very similar in genemal apparance, although $B$. bulhocrithuam has by some botanists been referred to the gemus farmu ( 'anaway), becanse its carpels have single vitter hetwen the ribs, whilst $/$, flexuonnom has three. The former is also a plant of stonter halit. looth have umbels of small white flowers, much diviled leaves with very narrow segments, amb a single romulish tubur at the root of each phant. $D$, llesuosm is rommon in wowls, pastures, waysidus, \&e, in most puts of liritain. li. hullocosfonnm is fumbl only in some of the chank distriets of Cuclamel, but is almulant in m:ny parts of Sinron'. IS. ferulacome likewise allorils tubers, which are used as food in Greece. The some-

What similar tubers of another umbelliferous plant, Oencuthe pimpinelloides, which grows in the pastures of some farts of the sonth of liggland, are sometimes also nsed for foon, notwithstanding the very poisonous qualities of some of its congeners. See Water-deopwort.-A Hinalayan nmbelliferous plant (Churophyplum tuberosum), a species of Chervil (f.v.), yields cdible tubers or curth-muts.-The name E. is sometimes extendel to other small tuberous roots of similar quality, althuogh produced by phants widely remote in the botanical system, as Apios tuthrose and Lathyrus tuberosus. See Apios and Lathyrus.

EARTHQUAKE, the term applied to any tremor or shating of the solit crust of the earth. The frequent accurrence of earthquakes, their destruction of life and property, their influence mon the solid surface of the earth, and the mysterionsness of their cause, force them unon our attention. It is estimated that 12 or 13 earthquakes, destructive more or less of life and property, "ecur every year, and it is well known that the surface of the globe is never free from sensille evidence of the continued operation of earthruake arency-that in some quarter or another tremors or slight slakings are always taking place. When these are of a serious nature, whole cities have been destroyed; fertile districts, with all their fruits and grain, have been laid waste; and enormons masses of human beings have lost their lives. No less than 60,000 perished in the great Lisbon earthguake; while in that of Calabrin, in the end of last century, 40,000 were destroyed. It is estimated that as many as $13,000,000$ of the luman race have thus perished: The great changes which earthquakes promine on the earth's surface deserve the careful attention of the reologist. They disclose to him an aseney which seems to have been at work during every perion of the earth's history, and which has altered the earth's surface to an extent that can scarcely he imagined. The observed results of earthquakes which more immediately demand his attention are such as these: the new lakes and river-courses which they form, at the same time obliterating the old ones; the new valless which they hollow out: the fisswes of varions sizes they furm; and the immense landslips they frequently produce. But the mysterious nature of the producing cause of earthquakes is also a strong incentive to their study. It is unfortunately true, that the most popular scientific inquiries are those in which the imagination has large play: dry inductions from observed phenomena are not suited te the geuins of popular modern science. Consequently, earthquakes, where every attempt at explaining their origin is theoretical, from the impossibidity of obtainins. direct ohservation, affording as they do a wide ficld for the play of the poctic faculty, find phenty of students.

No portion of the earth's surface is exempt from the influence of earthquakes. Egypt has been less visited than perhaps any other comitry, but even here we have the record of one which took place in 1740 A .15 ; and Hollaud, with its loose alluvial deposits, has also felt their power. Nor is the hed of the ocean exempt; records of many subagucous earthruakes exist, taken by vessels at sea, semetines masing over the wint of greatest disturbance at the monent of the shock. in like manner earth. quakes have heon ative at every period of the earth's existence, breaking up its solid erust, elevating or depressing its surface, and doing as much as any other single agent to bring it into its present condition. They have luen probahly at some periods more active than at others, just as we find that sume districts arn now more liable than others to their visitation. So well definel, inteed, are the

## EARTMQUAKE

Jocalities where earthquakes oceur, that it is easy to exhihit their limits on a map. 'Ih'y are most frequent arome the present lines or contres of volemio action (see Voncavo) ; and thad frequency and violence seem to hear some relation to the activity and intensity of the associatel yolcanoes. Observers of volenie jumomena have noticed that every great rruption, in whatever part of the world olserved, :thed whether from a voleanic vent on Jand or leneath the ocean, is accompanied ly warthruake shocks of yreater or less violence mil thratmo ; while, on the other haml, those observine earthprakes speak of thene as aceompaned by voluanic eraptions, and of their often beng stopped on the opening of voleanic vents. It is, however, in important fact that, although regions of active voleanic action are those of most frequent earthquake movements, yct the most violent carthquakes do not apprar to have occured in these regions, but, on the contrary, in elistricts lying some degrees away from the nearest volcanic action, as, for instance, in the famous earthquake of Lislon. Districts in which there are extinct volcanoes are not more liable to such visitations than num-volcamie regions.
The phenomena connected with earthquakes have been variously deseribed. Many writers refer to appearances in the heavens, or changes in the atmosphere, which to them seem to have some connection with the eatastrophes they narrate. They tell of irregularities in the seasons preceding on fullowing the shock, of sudden gusts of wind interrupted by sudden calms, of violent rains at unusuat seasons, or in countrics where such phenomena ite ahnost muknown, of a reddening of the sun's dise, of a haminess in the air often continued for montls, and similar phonomena. But these are so irregular in their appearance, and have been so seldum observed assuciated with more than a single earthquake, that, in the absence of any decided reason to the contrary, there seem good grounds for believing they have no real connection with the earthquake. It is different with underground noises, which frequently precede, accompany, or succeed the ocenrence of earthquakes, or some of the shocks of them. They are undonbtedly intimately connected with the shock, yet earthquakes occur, even of the greaicst violence, which are unaccompanied by any sound whatever. Different descriptions have licen given of these subterranean noises. In sume carthyuakes, they are likened to chains pulted about, increasing to thunder; in others, the sound is like the rumbing of carriages, growing gradually louder, until it equals the loudest artillery; or like heavy wagons running away upon a road; or distant thunder; or like the hissing produced by the quenching of masses of red-hot iron in water; or like the rush of wind underground. As there have been earthquakes withont snlterranean noises, so there are frequently, in South America and elsewhere, underground sounds which are not followed by earthquakes.
The more intimate earthquake-phenomena are more uniform. Sometimes there is nothing else felt than a trembling or gentle motion of the surface, without producing any injury. In severe earthquakes, the almost invariable succession of phenomena is first a trembling, then a severe shock, or a succession of shocks, and then a trembling, gradually becoming insensible. The violent shocks are instantaneons, and very few in number, sometimes only one, usually not more than three or four. In the intervals between these, smaller shocks or trumblings take place. The severe shocks do the mischief. At the point or line of greatest disturlance, the shock has a distinctly vertical direction, coming from below upwards. As
we leave this point, the direction of the nowion heenmes mone and mone lorizontal, fraulually alsu dereasiner in intonsity until it beremes insensible. This frorressive movennent is ]ronneme ly an eurthwave or true umblation of the solid erust of the rarth. Thse whollo mass of the ture is bot moved at onee, but only the waverorest. In the sase of the earthouake at lisbon, the progess of the wave was roughly calculaterl; it was shown to have Hanl a very geat velocity, and to have listed only for an instani at any me sunt. 'The arra affecten' on this oceasion was very cxtusive Thu shock was folt on tla whe side ats fir as the sonthern shores of Finlam, abd on the other it reached bergond the st Lawrence in Canada, and was oleservert in somu of tha West lndia lalands-an area of no less than $7,500,000$ sjuare miles. The force required to mover this must liave been enomons, fur, sulpmse the thichness of the earth's crust moved to have beun no more than 20 miles, then $150,(4) 0,000$ cubic miles of solid matter was moral. The influence of this eartli-wave is communicaterl to the sea, when the rarthquake is near the shore, or on the bed of the ncean. The sea swelle, and slightly retires from the boach, and then a great wave rolls in upon the shore, At the Lishon earthqualke, this wave rose to a hejght of 60 feet at Cadiz. It carries with it scansumi], scattering it uver the surface of the earth, for beyond the ordinary reacle of the sea.

Of the various theories as to the wature of earth. Gllakes, we can only refer to the most important. All theorists are agreed as to the conncetion Jetween volcanoes ant carthomakes; that they are protuccd ly the same subterranean agency. The existence of a molten fluid mass in the centre of the carth, is the starting-point in all execpt the ?limical theory propounded by Davy, which, though in the end abandoned by him, still finds supporters. When he diseovered the metallic bases of the earths and ablialies, he threw out the idea that those metals might abound in an nowitlised state in the subterrancan regions, to which water must oceasionally penetrate. When this occurred, gascous matter would be set free, sufficient to produce the earthquake, the metals would combine with the oxygen of the water, and heat enough would be evolved to melt the surrounding rocks.

The internal molten mass being taken for granter, it is generally supposed that the generation of immense bulks of clastie gases, through the influence of this rast source of heat, would proluce an explosion sufficient to account for earthquakes. Mr Mallet, in an elaborate report on the subject presented to the British Association, proposes an ingenions theory. He assumes that rolcanoes, and the centres of carthquake disturbances, are near the sea, or other large supplies of water ; and he says that when an irrustion of igneous matter takes plaoe bencath the sea-bottom, the first action must be to open up large tissures in its rocky material, or to lift and remove its ineoherent portions, such as sant, mud, gravel, \&c. The water on meeting the heated surfaces assumes the spheroidal state; while in this condition, the intestine motion may be great, lont little steam is generated, and no impulses will be conveyed to a distance except only the tremblings which precede the shock; but no sooner lave the surfaces cooled, than the water comes into close contact with them, and a vast volume of steam is evolved explosively, and blown off into the deep and enld water of the sea, where it is condensed, and thus a blow of the most tremendous sort is given at the voleamic foeus, and being transferred ontwardly in all directions, is transmitted as the earthquake sliock. The surfaces of the ignited material, however, now cooled down below the point at which
steam can low generated ranily, merely keep up a gentle clullition, which is transuitted as the trembling after the shock, (In the surfaces again beconing heated ly ennduction from the moilen mass, the various phases are again repeatert. This he considers the chief cause it earthmakes, hat he suppuses they may also be due to the comation of stean thronh fissures. and its irregnlar and $f^{\prime \prime}$ sultum condensation under pressure of shatwater ; or to wreat fractures anl dishontions in the rucky roust, sumbenly promed ley pressure acting on it from beneath, or in any other direction,

The latest, and perinips in all rempets the most satisfactory theory, is that ponnsel hy the larothers turers, who consibler the problucing rause as an artual pulsation in the flnin matter homeath the crust proparated in the mann of preat waves of translation, from edmmmens mptures camsul Iy ton siom of clastic matter, and flating forwards on its surfae the superimpused rocky crust of the earth. This the ery acomeds with tlu phombena of orthquakes, and mects woth a remarkable emitmations in the structure of certain membtain masses. Siee Apralammas.

EARTIS, in Clumistry, atre a class of substances remaded ly the alchemists amel ohder chemists as clementary, and whel are insolulde in water. 'The earths proper are now known to he conamme, ensisting of a metal in combination with oxyou, The list inclules Alumina, Glucima, Zircomia, Thuria, Didymia, Lantana, Ceria, Tttria, Terlia, Erlia, They do not alter wegetable colours, are sulnble in acids, and are precipitated from their solutions ly ammonia, potash, or soda. The Aloulive Eurths have alrealy been noticel. Ee Alfilies.

EARTHWORKs, in Fortification, is a gencral name for all military eonstructions, whether for attack or defence, in which the material employed is chietly earth. The word detheosk, however', has lately receiverl a now importance, in referance to a disenssiou anng military cnomeers, whether earthwork defences generally are lutter or worse than those of masomry. The subject camnot he disenssed here, but its ren ral character may loe indicated. The fracture of the Iinssimn sranite furtifications at lomarsum, ami the Alostinate defence made within the carthen Tefences at Selastopel, lad many writers, abont the year 1555 , to express a preference for earthworks instearl of stuneworks. Mr I. Feranson (Iorfammenth Protertel. 1sin6) has especially distinguished himself by lis adrocacy of this view. The reasons urgel are-that masses of earth can le more quickly and eluady put up than masses of masomy ; that in most phaces earth is mome realily obtaned than stone; that if an carth. work be linocked to ruin ly lalls and shells, it can he repaired in a brry short time: and that the defenders are not expused to so much injury as in masumy-works, where splinters of stone fy about in a perilons way. The late Sir John Burwow, the lading military rngincer in Eneland of his hay, combated these views. ITe eontemped, amony other thimes, that as a giben amomat of commonting will molse at meh larser beach in earthwork than in stoncwork, the latere is hest fitted to provent "apinte by assmalt. Ile insistad that earthworks shomblibe begarded rather as tomprary $x^{2}$ pulients than as purnsel and permanent constructions: and hu clamm the athority of rontingtal comeneers in support of this opinim. Siee further under formpermon.

 many sperinc, all of them protty chosely resemblins in characters and habits the coumon E. or Dew.
worm (L. terrestris), which is everywhere plentiful in liritain and thronghout Eurone and is familiar to evergholy. It has no head distinct from the buty, no eycs, no antemer, nur any organs external tu the ringe of which its body is composed, except minnte lristles fointing lackwarls, of which cach ring bears fonr $\mathrm{p}^{\text {rair, and which are of use in its }}$ locomotion. It sometines attains to nearly a foot in length, anl more than 120 rings have heen connted in its lody. The end at which the month is situated is pointal, and the tail is Hattened, wholst the general form is cylintrical. The month consints merely of two lips, the mpler $\mathrm{l}_{11}$, elongaterl: thore are 10 , teeth nor tentreles, and the wom sulnsixts by swallowing fine particles of the suil. from which its rinestion urgans extract the ri, estible matter. the rest bein! wided often in little intestine shaper hequs, valleel womectats. on the surface of the smomet. Thle loconntion of the E. is cflected hy means of two sets of museles, which mable it to contract and dulate its rings; its bristles preventing motion backwards, and the whole nuscular edort thens resulting in progress; whilst the expmasion of the rings, as it contracts the anterion secments, and draws forwarl the himeter parts, widens a passage for it through earth whose particles ware close torether lefore. Earthworms

Earthworm (Lumbricus terestris)
$a$, earthworm; $b$, anterior extremitr, sbewing the mouth the bristles are also shewn ; c, ege, corlumins two youns; d, oung escaping from the cge. are thus of rery great use, their multitules continually stirring and loosening the seil through which they work their way; and moles, pursuing them to feed on them, stir and lewsen it still more; whilst wom-easts graulually acrumulate on the surface to form a layer of the very himest suil, to which it is supposed that the hest oll jnstures in a great measnre owe their high value.

Jinthwoms do mot often risit the surface of the Erombl, except during night, and when the gromd is moist. In the erening during or after iain, $n^{\circ}$ in the norminer when the dew is atmandant, they may sometines be seen travelling ahout in Ir rat mumbers. Buth drought and rold canse them to retreat more deeply into the earth. -Tbeir respiratiom in effected lymeans of little saes, which communiate by mimite pores with the external air. They are hermithomite, but mutual fecundation takes place ly means of the thickened knot (rlieflum) which is situater before the middle of thair lomiy. Thair erses often contain two embryos, ame tha young worns escape ly a sort of ralvular (1) $x$ ning at the ent.
hesides their usefulness in the improvement of the soil, earthworms are of impertance as food for birds, fishos. der. Their value as bait for fishes is woll knems to wory ander. The instinct which frompts them to hasten to the surface, when, in guest of baid, the angler shakes the suil with a spade or fork, is podrably to be refored to the smidar shaking on the aproweh of their constant enemy, the mole.

An L. of ereat sizo is ermmon in the East Indies, wherever the climate is moist, from the Ilimalay to Coylon and dara. It is Icthyonhes glutinosus,

## EASEL-EAST TNDIA ARMY.

EASEL. This structure, the object of which is to support the canvas or panel of the artist at a converient height for work, has been used for ages pretty mach in its present form.

EASEMENT, im English Law, has been defined to be 'a privilege without profit, which the owner of one neighboming tenement hath of another, existing in respect of their several tenements, by which the servient cowner is obliget "to suffer or not to do" something on his own land for the atvantage of a dominant owner.' -Gale on Dusements. The rights comprehented under the title of easements are of a very important kind ; they include rights of water, rights of way, rights to light and air, rights to support from a neighbouring soil or honse, rights to carry on an offensive trade, \&c. An easement is an ineorporeal Hereditament ( $q . \%$. ), and correspouds in many respects with a servitude ( $4 . v$ ) in Scotch law. But an easement is suore limited than a servitude, inasmuch as it comprehends those rights only which carry no title to the profit of the soil. These latter rights are in England known as Profits a prondre (q. v.). An easement cannot exist apart from an estate in land, it being nocessary that there shond lue two tenements, the one enjoying the right (dominant), the other over which it is enjoyed (servient). An easement must be constituted by deed or by Prescription (q. v.). It may be extinguished by an actual or implied release. When a party entitled to the enjoyment of an easement is disturbed in that enjoyment. he may cnforce his right hy action at law, or he may cater apon the servirnt temement, and abate the nusance himselt. 'The Anerican law on the subject of easement is remulated by the same princifles that prevail in England. Sew Kent's Commentaries on American Lens.
 the morning, and Lat. oriens, the rising, i. e.. sun) is, vagnely speaking, that quarter of the horizen where the sum rises, or which a person with his face to the south has ou lis left hand. It is only at the equimoxes that the sun rises exactly in the east puint. A line at right angles to the merinian of a plaw pmints exactly east and west. Sce Meridian ant herezon.

From very early times, the east has leen invested with a certain sacred character, or at least held in respect wer other points of the compass. It was the practice of the anciont pagans to fix their altar in the castern part of their temples, so that they mingt sacritiee towards the rising sun, which in itsilf was an object of worship. 'l'ha, eustom of vonerating the east was perpetnated ly the early Ghistan sharch from variens areumstances men. tioned in the saered recorl. For "xample: "The Glory of the Goml of lsadel cante from the way of the rast.- lizek. xhii. ". There came wise men from the rast to derusalum.' Matt ii. I. 'And, lo, the Htar, which they sim in the east, went before them."

Matt. ii. 9. Tradition heghtened respect for the cast. It wis sail that rhirist had been phaced in
the tomb with his feet towards the east, and that at the day of judgment he shonld come from the eastward in the heavens. Looking towards the sum in the east in praying or repeating the creed, was thought to put worshippers in remembrance that Christ is the sun of righteonsness, and such an attitude was accordingly adopted as an aid to devotion. Fron these rarious circumstances, the building of churches with the Chancel (q. v.) to the east, bowing to the east on nttering the name of Jesms, and burying with the feet to the enst, were introduced as customs in the church. In recent times, there has been a general disregard to the practice of turning formally with the face to the east on repeating the creed, and, as is well known, the attempt to revive it ly a party in the Eughish church has caused considerable dispeace. It is in curions instance of the inveteracy of popular custom, that in Scotland, where everything that savoured of ancient usage was set aside as popish by the reformers, the practice of hursing with the feet to the east was maintained in the old churchyarls, nor is it uncommon still to set down churches with a scrupulous regard to east and west. In modern cemeteries in Encland and Scotland, no attention appears to be pail to the old punctilio of interring with the fect to the east, the uature of the ground alone being consitercd in the disposition of graves.

EAST CAPE, the name of the most casterly headlands of the islam of Madagascar, of the North 1sland of New Zealand, and of Siberia or Asiatie Russia. The first is in lat. $15^{\circ} 20 \mathrm{~S}$., and long. $510^{\circ} 15^{\prime} \mathrm{F}$; the second in lat. $37^{\circ} 40^{\prime} \mathrm{S}$, and long. $175^{\circ} 40^{\prime}$ E., being almost precisely the antipoles of Carthagena in Spain ; and the third is that extremity of the Old Workl which is nearest to the New, being separated ly Behring's Strait (q. v.) from Cape Irince of Wales in America. It is in lat. $66^{\circ} 6^{\prime} \mathrm{N}$., and long. $169^{\circ} 38^{\prime} \mathrm{W}$.; or rather, to follow the uatural reckoning, $190^{\circ}-2^{\prime} \mathrm{E}$.
EAST INDIA ARMY. When the East [ndia Company (4. r.) first sent factors or agents to India, an army was not thought of. Military forces arose ont of the exigencies of the times. Some of the first troups in the Company's pay were mere alventurers; some were liberated convicts; some deserters from European armies. Gradually, organisation was introdueed, and improved arms fromished. As the power of the Company in* creased, natives entered the battalions : until at length most of the troops were Hindus or Mohammedans, drilled ly an-commissioned offieers sent mot from England. A few reginents were raised in Fagtani ; it such larger mumber were raised in India; lutall alike were otheered by the Company's favoured English offiecrs, largely paid, and having many op portumities for naking rapiul fortunes. The ranks were filled hy culistment; the Company never eompelled the natives to become solliers; the fay offered was always sisch as to induce a sufficient number of men to (enter. Their periods of leave of absence were liberal; and after a certain mumber of years' service, they retired on a pension sufficient to support them for the remainder of their days.

At the perionl immediately preceding the outbreak of the hevolt in 1857, the army in the pay of the Company enmprised about 24.0 on royal tropps (lent to, and biul for ly, the (ompany); 18,000 European tromps raised and drilled by the Company in Fandand; 180,1060 native regulars ; and 00,000 native irregular horse - making ahout 280,000 in all. This large force was irrespective of 40,000 contingents furnishol by depemdent native prinees, and of the native amies belonging to the imberement and semi-dependent princes. The Company's troops
furmed three distinct armiss, each umler its own commander-in-chief, and each stationed in one partienlar presidency. In these three armies, three kinds of trons-Enropens, nation regulars, and native irregulars had their own spectal organisation. In order to secure unity of action when necossary, it was customary to give the conmander-in-chinf of the Bengal army precedence ower thosi of Matras and lionlay; he was in effect, commander-in-chief of the whole of the 'mmpany's forers. There were tow few Luglish officers wath the native regiments, and these, in most easce, knew tom little of the men umdur their command. This was not the cunse of the Revolt in 18.57, fut it was one of the circumstances that led to the rapid spread of the levalt when once hegm. 'Tu wlat extent this tine army melted away during 1857 and the two following years, is described moder lxph. Speaking pometally, it may be said that the armies of the Madras and bombay presidencies remained faithful, especiatly the infantry. It was in the Bengal amy that the clisruption chiefly occurred. The irregulars, loth eivalry and infantry. raised amongst the Sikhs and l'unjabees, were in ilmost every case faithful.

In Anuast 15:s, the act which transferrel the grovernment of Inchia from the Company to the crown received the royal assent. The immy was transferred as well as the political power, is the Sikhs had behaven well, most of the regiments from the P'unjab were retained, as well as most of the native regiments in the Bombay and Datras presidencies; lant it was not deemed expedient tor restore the native regiments of liengal proper, which had proved so treacherons. In that jear, at the suggestion of Earl Canning, a conmittee was appointed to inquire into the whole circumstances relating to the reorganisation of the army. The Company originated the inquiry, but the commissioners did not make their Report till after the transfer of the Company's powers to the crown. Althongh the commissioners' heport was presenter in the sumwer of 1859 , very little was effected during the remainder of that year. or in 1860, to reorganise the Indian army; matters were kept together in a provisiunal way, Meanwhile, when the Eurojean trupis of the Company's army were turned over to the crown, a disturbance, amounting almost to a mutiny, occurred. The men claimed that, as they had enlisted into the Company's serrice, they onght not to be transferred withont their own consent asked, or without receiving a bonus on re-enlisting. To prevent a dangerons excitement, the government allowed such as chose to retire.

In 1861, an act was passed reorganising the Indian army. The british portion of it now forms part of the Queen's army generally, with certain honorary distinctions, and takes its than at home and in the colonies like the rest; but the expenses are paid wat of Indian, not imperial revenues. The nutive portion is managed wholly in India. A majority of the olficurs educated and commissionel by the Company having suffered greatly by the Revolt, certain comprensatory advantages were conceded to them. On the reorgansation of the lndian army in 1861, the 21 st Hussars, with the $100 \mathrm{th}, 106 \mathrm{th}, 107 \mathrm{th}, 10 \mathrm{sth}$, and lo9th Foot, were formed from the European troops previously in the service of the East hindia Company.

EAST 1NIMA CONPANY. On the 3ist December 1600, a charter was granted by Queen Elizabeth to a number of London merchants, under the title of 'The Governor and Company of Merchants of London trading to the East Indics." From the time when Vasco de Gama effected the eastern passage to India, by donbling the Cape of Gooch Hope, in 14!7, the Portuguese earried on an
eatconsive tramb. wath that rommery, malfoctect by rivals until manly a rentury afterwarls, when the
 them. 'This commention heame formidable when two - East laniar "umpanies" wore "etahlumbed, whe at Amsterlam, amb we in Lomedon. It is of tho latter al these that we la pe trat. 'The chater was exclusive, as is usual in sueh cases; prohining the rest of the community from trating within the limits assignoll to the Company. Thase limits wore chormone come prising the whole space, hand and sea, from the Gap of Cool Hope pastward to Cap Hom-i. e, the whole of the ludian and lacilie oreans. The chatrer was for diftem years. Tho compuny apmody sent ont shijs to Jaya ind Smantra, whinh weturned with calicoes, silk, imlisn, and spices. It wats thon dutuminal to make some limd of seth monta on the coast of Himdustan itself; amd alnont $1612{ }^{2}$, the Company olitained permission from the native brinces to establish factories or ermencis at surat, Ahmedalrad, Cambay, and Conso.

The Companys charter was renewed from time to time, with various monlifications, lont nut withent much contention and ditieulty. Gradually estalslishments were furmed in Java, Sumatra, Fornen, Gelehes, Malacea. Siam, the Banda Islands, aml other places in the East: as well as on the limmmandel amd Malabar coasts of lmdia jtselt. 'Ilse tirst heginning of Madras dates in 1640, of Calcuttit in 1645, and of Jombray in lfich as chicf estallishments of the Company. In 1662, Charles 11. gave them permission to make war and peace on the native $j^{3}$ inces'-a privilege of which they largely avided themselves for nearly 200 years.

In 1608 , the erown granted a charter to a $n \mathrm{~mm}$ E. 1, C., who offered a lum of $£^{2}, 000,100$ to the state: lout this naturally led to wranglings, and the two companies were ninited into one by an act of parlia. mont passed in 1702. The constitution then estalblished was maintained with little alteration as lung as the Company existed. Every shareholier wha held £500 of the Compay's stock became a member of the Court of lroprietors; and this court had legislative functions in all that related to the Company's affairs. The proprietors anmally chose It to form ac Court of Directors, from those of thein number who held not less than £2000 of stuck. Six of the directors went out of office every year ; they retired in rutation, so that each hal four years of office. It was a general custom with the proprictors to elect the same pursms as directors over and over again. The Conit of I'rugrietors was to mect once a year, or oftener if necessary: the Court of Directors as often as the directors chose, provilem 13 were present. Theoretically, the constitution of the Company was very democratic; hut practically the affiniss were in the hands of the directors; for the proprietws towk little ather interest than in receivint their half-yearly dividends. The proprietors hal from one to four votes each, according to the amount of stock helid by them. The Board of Control, of later formation, loore relation to the governmental affairs of 1ndia.
lroperly speaking, the Company were ondy merchants: semding out bullion, lead, ywicksilver, woullens, hariware, and other goods to India; and bringing home calicoes, silk, diamonds, tea, porcelain. peper, hugs, saltpetre, \&e. from thence Not merdy with India, but with China and wther parts of the East, the trade was nonopolised lyy the Com. Hany ; and honce arose their great trade in China tea, forcelain, and silk. Jy degrees ararice and amhition lel the Company, or their agents in India, to take part in the quarrels among the native princes; this course gave them power and influence at the native courts, from whence arose the acquisition of

## EASTER

Christians coldomand Easter on tha 14th day of the first Jowish montla or mon, comedring it to bo equivalent tu the Juwish l'assener. 'Jhe: Wenstern chmeless celehrated it on the sumblay after the fome trenth day, holding that it was the conmemoration of the resurreetion of Jesis. The C'onneil of Nice ( 325 A A.) decidenl in favour of tha Wistern nsare, braming the bastom usace with the mane of the 'guartatheciman' horesy. 'This, huwerer, miny sotilcol the point that lhasher was to lo hell, not upen a cortain day of the month or mon, lat on a sumbay. The proner astrommical verele for calcmating the occurence of the Lhater mon was mot determined ley this comeil. It aprears, however, that the Mromic Uycle (f.v.) wats alroaly in use in the West for this phopman: and it was on this eyelu that the Gregorian Calemlay, intronemen in lisw, was arrangel. The methon on which this caboutar is constructed is too complox for deseription here. An elalwate account of the whole matter was published by I'rofessor De Norgan in the 'ompanion th the British Almanac in 1845, and to this the reater is referreal. The time of biaster being the most ancient and important of all the movable feasts of the Christian Church, determines all the rest. lt was debated, at the time of the intronaction of the Gregorian Calman, whether Laster shmald contime to be movalle, or whether a dixed sumbay, after the 2$]$ st of Mareh, should not be ahloptein. It was deference to ancient custon that lad the ecelesiastical anthorities to adhere to the mothod of hetermination by the mone. It mast be remenabered, however, that it is not the actual mon in the heavens, nor even the mean mom of astronomers, that regulates the time of Eanter, but an altogether imaginary moon, whose primls are sit rontrived that the new (calemar) monn always follows the real new moon (sometimes by two, ir fven three days). 'The eflect of this is, that the lith of the calendar monn-which han, from the times of Muses, leent considered 'full mom' for reclesiastical purposes -falls semerally wh the loth or l bith of the read mon, and thas after the real foll man, which is wemerally win the 1 thth of Joith day: With this explanation, then, of what is meant liy full moon,' rize, that it is the $1+t \mathrm{l}$, day of the calmular mom, the rule is, that Waster laty is always the dirst sumby after the paschal foll mom. i. t., the full mom which hapluens new or next aitur the olst of March (the besinning of the ecelesiastical year) ; and if the full mon haprens puna a sumlay, Eiester Day is the sumday after. Fire any given year, the diay which the paseland full mon falls, ani then lastur Hay, are fund by the following table and rule-

| $\begin{aligned} & \text { bars of } \\ & \text { the Moath. } \end{aligned}$ | $\begin{aligned} & \text { lruin. } \\ & \text { huctier } \end{aligned}$ |  |  | inf | $1$ | $\begin{aligned} & \text { inden } \\ & \text { Xianter } . \end{aligned}$ |

'The emblass Ostara or Lastre smmes to lave lwen the personitication of the mominat or cast (q. v.), and also of the uponing rear un sumin. The Anglo-saxon mame of April was Listormonath : anf it is still known in Ciermany as Ostermonath. The wordiz of this beine semmis to have strack deep root in Northern dimmany and was lounght intor Eneland ley thu Naxons. It contimed to be colebrated in mayy parts in the morth of Germany down to the bexmine of the pesent century, lis the kindling of hentims ame monerons other ritas. bedeles. Lake the Hay alservances of Enghand, it was wrexially a festival of jog. With her heual pulioy, the chureh endeavoned to qive a limistian significance to such of the rites as could not be youted out : and in this cass, the compernom was particularly easy Foy at the rising of the natural sma, and at the awaking of nature from the death of winter, became joy at the rising of the sun of liadhemsmess at the resurection of 'larist from the grave. The lumfires can be traced in the ereat ' pachal tapers. sometimes weighing sion lhs. witl which the ehurehes were lighted on Waster Five. In the ancient chureh dishmements of st Mary-at-Hill, in the city of Lombon, there is even an entry"For a quarter of exhes for the hallowed dire on laster Eve, $6 \%$

The most characteristic Easter rite, and the one most widely ditfinsul, is the use oi Pusch (i. e.. Dister) coys. They are usually stained of varions collours with dye-wools or herls, ad t poople matually make presents of them; sometines they are kepit as amulets. sometiuses catcu; games are also flayed lyy striking them against one another. In some moorland parts of Scotland, it used to be the custom for pomes poople to go out early on 'Pasch sunday' ani search fur wild-fowls' eges for break. fast, and it was thought lucky to find them.

There can be little douht that the use of eggs at this season was originally symbolical of the revirification of nature-the springing forth of life in spring. The practice is not confined to Christians: the Jers used eggs in the feast of the Tassover ; anl we are toin that the Persians, when they keep the festival of the solar new year (in March), amtually 1 resent each other with colonred egess.

From the Cluxistian point of viow, this 'Feast of Frus' has beeu nsually considererl as emblematic of the resurrection and of a future life.

EASTER 1SLAND, originally DAVIS': LAvD, is a detached spot on the Facific, in lat. $27^{\circ} \because y^{\prime}$ S., and lons. $109^{\circ} 30^{\prime} \mathrm{W}$. It is of voleanie origin, rising 1200 feet alowe the sea; and it is moderately fertile, lout almost destitute of water. It leplongs to the Polynesian archipelago, of which it forms the southeasterly extremity. On this island, of thirty miles' circumference, and inhabited ly less than 2000 wretchal savages, there exist inultitudes of rude stunc statues, some of them of colossal size, and standing on long platiorms of Cyclopean masomes. The present inhabitants, whonse langrage is radically the same as that of Tahiti, have no tradition of the race that made them. The existence of these sculptures is thought to strengthen the conclusion, arrived at on other Grounds, that the Polynesian islands are relics of a submerged continent.

EASTER OFFERINGS or EASTER DUES, small sums prid to the parochial clergy in England ly their parishioners at Easter, as a compensation for personal tithes, or the tithe for personal labour.

EASTER TERA, LEGal. For a gencral history of the law terms in Eugland, see Law Terms. Easter 'Term was formerly dependent upon the movable feast of Easter, and was hence called a movable term. It commenced on the Wednesday fortnight after Easter Sunday, and lasted till the following Monday three weeks. But by 11 Geo. IV. and 1 Wil. IV. c. 70 , amended 1 y 1 Wil. IT. e. 3 , Faster Term now begins on 15th April and ends on sth May. If any of the rlays between the Thurslay before and the Wednesday after Easter fall within term, no sittings in banc (q. v.) are held on those days, and the term is prolonged a corresponding number of days.

Eastlake, Sir Cimares Lock. President of the Royal Academy of London, was horn at Plymonth in 1795 , educated at the "harter-house in london, and entered as a sturlent at the Royal Aculemy. Subsequently, he went to l'aris, where he studied and copiod the great paintings then collewterl in the Lonrre. The return of Napoleon from Eilha compellod him to leave France. IIe went back to his native town, and supported himariff hy purtrait-painting. Wheu the Bellerophon, with Napolnon on board, appeared in the port of I'lymouth, En profited by the opportmity, and produced his first important picture, 'Naplem at the Gangway, of the Bellerophom, attemided by some of his Uflicers.' In 1817, Sir Charles visitel ltaly aml Grecee. sketching assiduously in looth comentries. During a residnes of several years in liome, he executed his "tiol of Allann Iearing a Blimel Woman to Mass,' 'Isilas the Spatan,' 'rilgrims arriving in Sislit of liome,' and many others, illustrative of Italian unstrms and scencry. In 1 ger ho was elected an Associate, and in 1530 a full member of the liogal Aculemy. Ilis " (ireek Fugitives l'risoners to Banditti,' \&ee, ahleal to lis alrealy great reputation: and in 18.41 appared what many encence to be his matarp-pince, 'Christ lamenting over Jorusalem.' It Bas immonsely admired, the duplicato painted for Mr V. roon bing reckoned one of the most valuahb. phitures in thy. Veroon Gallery. "Hagar and

1shmact' was exhibited in 1844; 'Heloise' in 1845; 'The Escape of Francesco Novello di Carrara with Tadlea d'Este, his Wife, from the luke of Milan,' in 1850: 'Beatrice' in 1855, \&c. In 1850, he was elected I'resilent of the Ioyal Academy, when he receised the honour of knighthool. Sinbsequently, he was apponted Director of the National Gallery, in which eapacity his services were of the highest importance; fur lesides its improved arrangement, many of the most valuable specimens of the best schools were alded to the collection. Sir Charles also acguired a hith reputation as a writer on art. In 184., he published Materinels for the Mistory of oil Puinting, a work of great learning and research. IIe contributed several articles to the Penny Cyclopurifia on subjects belonging to his profession, and expented a translation of Goethe's Furbenuchere. In 1853, he received the title of D.U.L. from the umiversity of Oxford. Ile diel December 1865̃.Ladi Listlales (born Elizabeth Rigly) is an artist of no mean power, and also has distinguished herself as an authoress by her Letters from the Baltic, Licominn. Thalis, and her articles on subjects connected with art in the Quarterly Revich.
PASTON, a flourishing town of Pennsylvania, in the Unitel states, stands in the fork between the rivers Delaware on the east and Lehigh on the west. about 20 miles above the head of navigation on the mited streams. Though the place is thus far cut off from the sea, yet, for internal trate, it clearly occupies a commanimy position. Its natural advantages, too, have been largely improvel. To say nothing of railways, E. is the common terminus of three canals-one of 60 miles, down on the right side of the Delaware as far as Bristol ; another of 84 miles, along the Lehigh, into the great coal-fich of the state ; and the third of 102 miles, leading across the country to Jersey City. Within the immediate neighburhood, likewise, iron ore and limestone abound. Haring an unlimited supply of waterpower, the town is the seat of extensive manufactories. Pop in 1870, 10,987.

EASTPOLT, a garrison-town of Maine, in the United States, is sitnated on one of the small islands of Passamaquoddy Bay, whieh receives the St Croix, the international boundary during its whole course between the United States and Tritish America. On the const, therefore, E. may be said to be the frontier town of the Union towards the north-enst. Its harbour is deep enongh for the largest vessels. The tide rises within it to a height of 2 a feet-a height far exceeded in many other parts of the Bay of Fundy, of which Passimaquoldy lay is an inlet. The place is largely engated in the tisheries and in ship-bailding. F'ol. (I5:(1) :3:

EAU Clibolde, a very fine liqueur, made in Martiniqu, by distilling the flowers of the Nammee Apple (Ifommen Americena) with spirit of wine.

BATT 1H: COIOGNE, a celehrated perfume, invented long an by the Farina family in Cologne, and sinee manufactured chielly by members of the same fimily: It is also minde in lrance. It consists pirincipally of spirits of wine, along with mumerons exsintial wils harmonionsly mingled to ecther, so as to produce a refreshing and gratefal scent. Ther recipe sais to be followed in the manufactaries at Cologue is twelve drops of cach of the assmial oils nemli, eitron, bergmot, orange, and rosemary, alons with one drachm of Malabar cardamons, and we wallon rectified spirit. Tho whole is distilled together, and the condensed liquid constitutes bin de Cologuc.

DAS DE JAVELLE is a solution of hypoellorite of potash, which, when alministered to man,
is stated to net, fownefndy on the nervons system, and to give rise to genesal righlity, and even to canse tetanic sparmos.

EDELEILATD, Johaxa Avorst, a phidosophical writer of Cremany, was lurn at Ilallerstadt, 31st Areust 1739; studied theolngy at Halle, 1756-1759; amf after syudium several years as a preacher in Iberlin auk C'harluttenhurg, hueame I'rufessor of lhilosophy at Ialle in 1775 , and Ioctor of Theolocy in 1808. He died 6th Jannary lso\%. İ.s first worli was his Nrue Apologie des Sucretrs (New A pulory of Socrates), 2 rols., Berlin, 177:; a work 11 which the rights of common sunse are vinulicated against the acelsatious of a narow theology. It was received with much aplanse both in Germany and in other countries. Among his other writinys may be mentioned, sittonlihe do Vernumf (Lthics of the Jeason), Berlin, 1751; Tlwomie der schünen Känste umbl Wiswenshaftrn (Theory of the Fine Arts aud Sciences). Halle. 1783: shly meine Citschichte? Ifor Pholosuphie (Thiversal Histury of Vhilasophy), Halle, 1755 : Memolbueh wer Acsthetik (Ilammel of
 ciner allyeme ine Deatsrlem symonymile ( 1 n Attempt towards a Complete Work on German synonyms), 6 vols. flalle, $1795-1502$ a work which was chriched and inproved hy Matas, 1818-1821, and arain by Gruber, 1826-1530. Int which was, at the time of its arpearance, the hest thiner of the kiml in the German language. Towards the close of his life, E. strusgled, but without suceess. acainst the specalative excessos of the new sehools of fhalosophys luaded by lant and Fichte. E. was a deas anil semsible thinker, as well its an agreeable and inter. esting writer.

EDELINEURG, a swall town in the Batraian Tialatimate, is situated ilrout 20 miles sonth-west of Mayence, at the junction of the Alsenz with the Nahe. It is notalale on accuunt of the ruins of its castle, which formerly belonged to the fanmons knight Franz of Sickingen, who was a devoted friend "f the carly refommers. 1 lis stronghold, which wats ance considered almost inmerenable, afformed a seenre retreat from danger and jersecntion to Nelancthon, Bucer, Ecolampadius, and Elrich von Hutten, the
last of whom comprosed several of his works hare. After the leath of Sickingen, the astle of Elombury was losiecrel and disnantled hy the Electors of Hesse and of Treves. I'rye about 500.

EDERT, Kiml Euos, a Iohemian pert, was lom at I'munc, 5th Jume lsol: educater there wal at Vienna; ami after filling several sitmations, finally settlen in Iragne, where he still resides. His chief works ave lis Diehtumen (I'vems), 2 vols., J'ragme, 18:4; : 0 editim, Nitutt. ISt.5; Whushe, cin Lumischmutionules Melelenvelicht in dree Bueheon (Wlasta, a Fobemian National Heveic Pom, iu three lionkst,
 fuyg Geväuyen (The Cloister, a Sarmative Jdyll, in five cantos), Stutt. 18 sin. These peans, waviatly the last two, are marked ly lyrical velmmence, and degance of lamgnare. They were recejed with applanke, partioularly in Bohennia, whose national traditions form their gromdwork, L , 's compositions shew a happy muion of the creman and (zech characteristies. II' has also written a darge manber of dramas, of which Thes riclulute (The Vow) (I:6t) was recurnd with pmblic favonr at frague. He las also published some meritorions lyrieal poctry.
 given wiginally by the horarelanal on indluential barty ammin the dows, th those of their comitrymen whoprofessed the hristian finth, amd who generally belonged to the poome and more irmonant class (Johln, thap. sii., verses $4,4!1$. Sivisecmently, it womld seem, the Gentile Clustimes, who were ignor ant of Helrew, employed it in a distinctive sense to designate their dewish eorreligimists, who, in anditioe to their hebief of Christimity, olserved the Mosaie law. lrenotus is tha first writer who makes use of the mane. It is hishly frolsable that the E. first beeame an orramised boxy or sect at letia, a city in Ierea, om the eastern side of the dordan, whither they lad leatiken themselves on the breakine out of tha Foman- $\begin{aligned} & \text { ewish war in the time of }\end{aligned}$ Hadrian. IJere, indeed, a strietly Juwish-C'bristian elmodis contimed to exist lown to the ntle century. Abones the E. howera, thrae was ly mo means at manimity of religious feolines or moifurmity of opmion. Two great divercent prirties are clearly recosuisable - the 1. perner. and the libionitio Nazarenes. The former were little different from Jews: their conceptions of the savionr were neatre and unspiritnal. They betieved that Upsus was simply a man distinguished above all others for

 conse they donied his supromatuml birth, fet not his resurrection: for "they livert in expectation of his spedy return to restore this eity uf (riml (n) rusaleme, and to reestallish the theneracy there in surpassing splemonr:' Neander. "loy were thu fremuine descemants of those Jumatisers who golamed the "hureh in the thas of the dpestlo Panl. The Fhonitic Nazarnes, on the other hand (who at the close of the 4 th c . serm to have dwelt dindly alwont
 any liave lean mome widely difinsed), were dewish Christians, in the better sense of the terni. 'They' conceived it to be their anm duly still to cirumeise. keep the Sublath, de:, hat they lat mo wish to impose the freulimitios of fudtrism on the Gentile ('hristims. 'They did not believe that (hristianity was morely at slarituation of dudaism, lat at new hate eome into [lae world, in which the Ciontide might
 wheal. Dike the striewe lis, they used a ciospel of Aembum: Int it montamed what the other dill not:th accomat of the supermatumal conception and binth of the Savina. According to Neander, who has
very thoroughly investigated this question, there Were a great many varicties of opninion anong the V, springing ont of the differences abouse spokn uf, whicli it wombl le todions torecom?. It is sutiicient to say that L, menism ( $\mathrm{d}, \mathrm{v}$ ) monlition Ebionism greatly, thrumf the introduction of a Jewish mysticism, wheh recognised in Muses and Clurist an inword ilentity of coctrine, and remarded them as revealers of the 'primal religion,' whose teaching, however, ham loeen sally commped. It is extremely prolahle that an Essenic Elowaite wrote the Clemeutine Homilics. See Clemens.

EBOLI (ancient Jhari), a small town of Sonthern Italy, in the Irincipato ("iterime, abont 16 mites east-south-east from sialerno, is phetmresquely situated at a considurable clevation above sea-leve. 'lobe climate, which does not become too colk in wiuter, notwithstanding the pasitiom of the town is very unlicaltly in summer, owing to the momber of strums in the neighombont. There is an anmal faire at E., whelu lasts 12 days. J'op. Ji30.

1: "(ENTRIC, or ECCENTRIC' ('IRCLE (in the l'tolomaje Astromomy). It was a fundamental doctrine with the ancient astronomers, that every leavenly latly mesed in a circle (the perfect figure), and at it unifom rate. To move otherwise than maiformly and in the perfect figure, would have
leen umbecoming a heavenly body! But some of them apuearel to misbehave ly moving unstealily, and in uther figures than circles. Of comse this was a mere deceptive mpearance; but then, to sure the fomlamental loctrine, it must be explaned. To explain it, they invented the eccentric circle. Simpouse a brody, such as the sun, to move in a circle ADE at a uniform rate, and a spectator to ubserve it, not from C , the centre of the circle, lont from E. Then, if the sun's movement in a

Eccentric Circle.
given time be from $D$ to $F$, and in an equal interval thereafter he from F to C , a spectator at C would observe these movements ass being circular and made in equal times, becanse at $\mathrm{C}, \mathrm{DF}$ and FG , leing "qual, subtend equal angles. But if the spectator, insteal of being at $C$, lie at $\mathbf{E}$, then, as the angles DEF, FLGr are unequal, the sun's motion will not appear to be uniform, nor will his path aplear quite circular. If, then, the earth, instead of leine at the centre of the smis orbit, le in a [losition away from it, the want of regularity in his movements will be explained. He will appear to describe unequal spaces in equal times. Accordingly, to reconcile the absersed fact with the fundamental doctrine, the ancients placed the carth at $\mathbf{E}_{4}$ a point away from the centre of the sun's supposed orbit. Hence this robit was called the Ercentric, in respect that its sentre did not coincide with that of the earth, which was considered as the centre of the universe.

ECCENTRIC, in Machinery, is a contrivance for taking an alternatius rectilinear motion from a revolving shaft. It consists of a circular dise or fulley, fixed on a shaft or axis which does mot pass through the centre of the disc. The riglit-hank figntre of the cut represents a side plan of an eccen.

tric; are the dise, the centre of which is at $b$; the inner cirche is the shaft, with its centre at $c$; re is a section dong tho axis of thu" shaft $d$; and ' $e^{\prime} u^{\prime}$ an wher-view. A hoop, fif, embraces the groove der', allowing the dise to tur'u within it. As the eccentric revolves with the axis, the lowop is alternately raised ambl lowerell, annl with it the roml, whicla is keyerl int" it at $h$. The rextent of the rise amd $\mathrm{fall}_{\mathrm{a}}$ of the roxl is coprial to twice ef, the distame betwern the" rontros. The cecentric is chictly usce whore a subssulitry motion of suall power is required; as for workine the force-pump that smpulies the boiler of asta:l11-emaine (g.v.).

7\%)

Circle. In such a figture as the eccentric circle, the eccentricity is the ratio of $\mathrm{D}:$ to the ralins. In the ellipse and ITyerlmla ( $\mathrm{q} . \mathrm{v}$. ), the eccentricity is the ratio of lualf the distance letween the foci to the semi-major axis. In older mathematical works, eccentricity is sometimus used as the mame of half the clistance between the foci of an ellipse or hy'berdola.

ECCHYMOSIS (Gr. frome ef, out of, and chymes, juice), a discoloration of the smrface, produced by blood effused below, or in the texture of, the skin. It is usnally attended hy swelling to a greater or less "xbunt, and is the result of injury. The presence of ecehymosis is somotimes alduced in conrts of law as a proof of violent injuries having beon intlicted during life, or vay shortly after a leath. A question with respect to this was raised in the celebrated case of Burke and Hare, the West Port murderers in Edinburgh. Ecchymosis may sometimes be diminisher hy applying cold cloths or a hander of ice to the surface, in the case of injuries quite recently inflicted.

E'CCLENFTELD, a township in the West lirling of Yorkshire, five miles north of Sheffiel. Tin? (IS71) 15,I71. The chief manufacture is contlory, but Hax, linen, and nails are also brancles of iulustry There are coal aud iron mines in the vicinity.

ECOLESIA'STES (Encr. the Preacher), the title (taken from the sepptuagiut) of a caronical book of the Old I'estament; its Ifobrew name is Koleleth, which signifies nearly the same. The inscription with which it commences is: "The words of Koheleth, the son of David, king in Jernsalem.' Its authorship is commonly ascribed to Solomon. In support of this opinion, however, there is not i restige of internal evielence except what arises from the dranatic use of his name, an expedient in all probability resorted to by the writer to give force and emphasis to his own rellections, masmneh as Solomon was held by the Jews to be the perfection of buman wisdom. The first who donbted the Solumonian authorship of the book was Grotins. Later eritics have advanced further than Grotins. The actual writer probably flourished, according to Dr Davidson, in the later period of the l'ersian bovermment, not long after the time of Malachi, i.c., $250-340$ B.C. Such is also substantially the opinion of IVosenmiiller, K nobel, Ewak, and De Wette. Heurstenherg, nuquestionably the ablest critic of the orthodox German schoot, considers that the conteuts of the book may best be explained by supposing the anthor to have liver in a period like that of Malachi, in which there previlied a pharisaical self-rightconsness, and melanchoty mummurims against the providence of fock. The dates assigned to it by 1 lartmam (vi\%, the beriod of the Matceaboes) and hy
 tained, as there is no trace in the book either of Grecian philosophy or language.

Tho chief arguments against the solomonian anthorship are thene. I. The writer indicates unconscbonsly his own posteriority in point of time ly making solomon say: 1 wers king over Israel in Jerusalem' (chay. i. verse $1: \frac{1}{}$ ) ; a thing which Solomon conlal not have said durbug his life, for he was king to the eme of it. 2. Tle condition of the cominty in the time of the writer, the oppression, judicial inpustice, the elevation of fools and slaves to high uffices, dee, do not fit the reign of Solomon at all, nor any preceding perion. 3. The langrage js post-exilian. biwald, the greatest Orientalist living, assurts that "the Jlebrew is so strongly
penetrated with Aramiean, that not only single ofternrecurring womls are entirely Armacion, but tho forcion influmere is infusen into fla dinest veins of the langutere.-(1)r favirlson in vol. ii. of llornes's Introduction to the Moly brovipham.)
lt is extremely dilficult to aseretain the stame. prist of the author. Ihe is deqply consineed that 'all is vanity and vexation of spisit.' lint whethere this eomviction spings wholly from a rolirimes viow of life, or is in part cansed by personal disapmontmenta, we have not sullicient internal avidence to detemmine. 'lhere is much in E. that, if it stombly itsulf, minht be thonght to be a mere pronluet of 'ynucal epicureamism, Thit it is mixed up with so mucls that is noller, with a faith in Gorl that rises high above the: crusling consilerations of the vanity of all mortal life, and the book temminatos so grandly, that it seems more reasonable to helieve that the aime ar intention of the writer was moral amd religions, and not cynieal ; that he painted the folly, weakness, and lubplessness of men in such strong colours, only that he might destroy their self-righteonsness, and cure $t_{1}$ em of that inability to read the laws of Fion, which self-righteonsness always prolnces. For what is the conchision of the whole matter? 'Fear God, and lieep his commandments: fur this is the whole luty of man.'

HCCLESIAS'IICAI, COMMISSIONERS TOR ENGXANE, "are a corporation with perpetual succession and a common seal, and with jower to take, purchase, and hold real estate, motwithstambines the statutes of mortmain.- Liums's Eecles. Lien Dy Philimore. The Ecclesiastical Commissinuers consist of all the Bishops of Eughand and Wales, the Deans of Canterbury, st Paul's, anel Westminster, the two Chief Justices, the Master of the Jiolls, the Chief Baron, and the judges of the Prerogative and Admiralty Courts; aud also nine lay members, seven to be aprointed by the Crown and two hy the Archbishop of Canterbury. The lay commissioners, including atl the judges, to le members of the Unitud Church of England amd lreland. is amd 7 Wil. IV.
 Viet. c. lll. "The Queen is cmpurared, by $1: 3$ and 14 Vict. e. 94, to appoint twa, and the Arehbishop of Ganterbury one (lay members of the Chureh of England), by the title of Chureh I'states Commissioners. The Ecclesiastical Commission thus constituted is the result of certain reports made by commissioners previously appointerl by the Crown. The object of the existing Commission is best explained by a reforence to the instruetions given to the original commissioners. "To consider the state of the sereral dioceses of Englame and Wales, with reference to the amount of their revenues aml the more equal distribution of episcopal duties, and the prevention of the necessity of attaching by commendam to bishoprics benefices with curc of souls; to consider also the state of the several cathedral and collegiate churcbes in England and Wales, with a view to the suggestion of such measnres as may rewler them more conducive to the efliciency of tho Established Church; and to devise the best muste of providing for the cure of souls, with special roference to the residence of the clergy on their respective benefices.' 'Ithe Ecclesiastical Commission was permanently established in the yoar 183 3 . In order that it should be provided with a fund to enable it to carry out such schenes as should appear to it desirable, the seven best endowed sees were lail nnder a contribution amounting in all to the anmal sum of £22,S00. In addition to the income thus provided, several canomies in the various cathedrals are abolished, and other ecelesiastical preferments are extinguished, and the emolmments of the whole are vested in the commissioners. The Eeclesiastical

Commissinners are required tolay before lier Majesty
 aulapter for carrying out the purposes of the act. It is [roviden] that mon [mondiner which rempires the
 rhuded, nom is the sumb to lee allixed to why deed, muless two at last af the rpiscoparl commatsinmers are present, amd conswhtine. Sotice of erver seliono is to be river to any eormation, argrecrate or sulu, affected thereloy ; ind thi. Hojoctions, if any, are to, he laid Jofore her Najesty in commal, together with the scheme. 'I'he sclum", if it reenjoce the royal assunt, is to be gezetterl, and thernpmacouires the bwor of an act of parliament. Jiy 19 and 20 Vic.
 sioners have luen transforred to the livelesinstical ('ommissioners. 'The latter boly have now, throwfore, in addition to their previrns powors, athority to divile or to unite existing parishes, aml to creato new districts. Such are, very hrietly, the powers of the Eeclesiastical Commissioners. 'The policy which bol to the apmontment of that Commossion is not a suliject for ond consideration. Fit it is casy to sec that the influence for rool and cvil oi sor powernl an institution, ower the chureh of lingland. is eropuous : and it cannat be matter of surprise that its proceerlings are watched with scrupulous jealousy. As it result of its deliberations duriner twaty-fise vours of its existunce, two now hishomios hat hesn crated and condowed, and a consiluralle nemblor of small livings had loen amemested.
( $n_{1}$ the other haml, it must he ahservol that much indignation has luen exented by the expenditure of vory large sums on tle purchase and impuroment of equscopal resibences. It is, no dombt, tittiner that the episcopal othee shomld be furmished with appliances suitable to the position and dignity of a bishon'; but the peculiar character of the revenues of the Eeclesiastical Commissioners must fet lorna* in mind in aprlying those revenurs. 'Ilo fimuts of which they are composed have been riolently diverted from the oricinal purpose of the donors. Puhbe necessity only can justify such an act. The plea put forwarl is the inequality of the revenues of the elergy, and the insnfticient amount of the incomes of many lunclices. But it may fairly be questioned whothre it is a roper application of thase funds to promote the convonience and haxury of those who are alyeaty liberally endownd.

ECCLESLASTICAL CORTORATIUN゙. The honhur of an ecclesiastical benence is, by the law of Eugland, regarded as a curporation. Eeclesiastical corporations are divided into aggregate anl sole. The former consist of several persons, as the learl and frllows of a collecre, the dean and chapter of a cathedral, and are kepit up by a contimal snccession of members. An ecclesiastical corporation sule consists of a single ferson and his shecessors in the honefice, as a Tishop, a rector, a parson, or a vicar. The ohiject of the common law, in thus regarding the incumbent of the lentiec as a corporation sole, is to preserve the temporalities which are rested in him, anl which wonld otherwise descend to his right heirs. The riglit of a rector or other corporation sole to the church and glebe, thourth said to be a frechold, is in fart little more than a tenancy for life. He is entitled to the full anoyment of the lrenefice during his life, but he cannot sell it, and he is even pmishable fur waste. He may work nines or pits which le timds in use, hut be is not entitled to open fresh mines. His right to timber is confined to falling it for repairs, but he is not entitled to sell it. See Comporation.

ECCLESIASTICAL COURTS are courts specially deveted to the consideration of matters
relating to the clergy and to religion. For the orivin of these courts we must mo back to the first days of Christianity, when the early Christians, aetine upon the injunction of St I'al- Dare any of rou haring a matter aerainst another er to law Fofore the unbolievers and ont lefore the saints" -had estallixlied comut: apart from those provided by the lewathen grownoms, for the settlement of their "ww disputes. These coupts were presinnd awo lye the hishops, whe tork cumizance of all matters, tempral as well is spiritual, arising amony tho hrethren. As Cheistimity adwanced, and was acknowlented as the revelation of the Almighty. these lishops' courts requirel an independent positiom, and were sufferen to exist concurrently with courts of civil jurisliction (Comle lith, i. tit. t. (d) equec. (thil), and gradually special matters were assimen as the suljects of their menliar juristictinu -wiz. questions of tithes, and matrimonial and testamentary causes.

Ill writers ,n the early constitution of Eagland are agreed in the ontum that. in this kingdom, there existed mon scprate ceclesiastical courts l lefure the Aorman Conguest. Previons to that time, all matters, civil and spiritual, were in use to be heard lefore the connty conit, in whicla the lishop, and the carl sat twether. Inat ley acharter of William I. a distinction was made for the first time between courts civil and veclesiastical. By this charter, authority was siven to, the bishops to hear canses ecelesiastical aceorting to the canm law. The hishons' courts having heen thus estatisished in England, they heeme a fritful somree of dispute hetween the crown and the see of Rome, the latter claminy suprene, juristiction in appeal in all canses ecelesiastical, This chaim was from time to tince concede] ly the weakness or necessity of indivitual sovereims, to be as frequently retractel when the cmergeney was past: in particular, ly 27 E. III. c. 1 . nnif 16 lich. II. c. $\overline{5}$, all prsons were prohibited, mider malty of Premunire (4. v.), from resonting to the conrt of Tumu or ofsewhere. At the Rictormation, hy 24 ILen. VIII. c. 12, on the recital that the hind is, mader cion, the henai of the church, and agrin, hy $2-3$ Hen. VIII. c. 이, the authority of the pme in matters ecclesiastical was fiually exclufed. In Pacon's Abrilloment of the Law, there are mumerated ten ecelesiastical courts-viz., Convocatim, the Court of Arches, the I'rex, erative Court, the Churt of Audience, the Court "Faculties, the Court of Peenlians, the Comsistory Conirt, the Arehleacon's Court. the Court of Jele. ratus, and the court of Commissimers of Review. (Firn a full account of these courts, refernce is mate to the several heals, and also to the article Duronses ('manos.) It is to be wherved that emo weation, though it purely ecelesiastical assembly, i , in its mature and its duties, distinct from the comets of which we are now treating.

The chief ceclesiastical courts which have at varions times existell in Seotland are the Ciencral Assembly, the Chmissary Court, and the Court of Teinds. The former is the trilumal for the consilleration of questions of duetrine amil discipline accurdingt the the Proshyterian usitue, and has existed since the Lieformatinh. Fice Assimbla, Cieveral; Complestar: Tmenconer.

 an mint issum by the cenut of Rame divinling Creat britain into, territerial bishopres, wher an Arehbislopl of Westminater. The brief was immediately Followen by a latural ly the newly appointed archlimhn, (t'matimal Wiscman) 'given out of the

Flaminian Gate.' At the commencement of the parliamentary session of 1851, the suriject of 'papal aggression,' ini of the measures $t$, be adyitel to conuteract it, sulperseled all other toppies of interest. It was in these circmastances that Lord John Itussell introluced the Eeclesiastical Titles Pill. By the Aet 10 (ieo. IV. e. T, it had been provided that the right aud title of archbishops to their respuctive provinces, of bishols to their sees, and of deans to their demeries, as well in Eugland as in Ireland, having been settled and established by law, any person wher than the person thereto entitled whu shouh assume or use the name, style, or title of archhishop of any province, Dishop of any hishopric, or dean of any deanery, in England or Irelanil, should for every such offence forfert eltoo. By the Roman Catholic party it was allereer that this enactuent struck only at the titles to exi-ting provinces and dinceses, anit that though the pope could not create an Archlishop of Canterbury, nor conld his nomonee assume that title without violating the law, there was un prohibition araiust the ereation if an Archbishop of Westminster. To meat this allegration, and romore the doult which existed, the L'ciclesiasticial Titles Aet was passed, its abject being to prohilat the assumption of such titles 'in resplect of any places within the l'nitel Kinglom.' The penalty of E100 for every contravention of the act is to be recuvered in aecordance with the provisions of the former aet, or at the suit of any person in one of her Majesty's superior courts of law, with the consent of the Attorney-ceneral in Englaud, or of the Lord Alvocate in scotlaml. The third section saves the episecrpal bishopis in Scotland from the operation of the act, providing, however, that 'nothing herein coutained shall be taken to give any right to any such bishop to assunce or use any hame, style, in title which he is not now by law cintitled to assume "r use.' The passiug of the act allayed the fears of the country on the suldject of papal atgression: and though its provisions were not very steatily com${ }^{1}$ lied with in frdand, no $l^{\text {rosecention }}$ under it took ${ }^{1}$ lace.
The Toman Catholic party having always consilfered the peual chanses of this act as a grievance, an arrangenent was made for the repeal of the act. 'This was recomplished by the Act ist and 35 Yict. © 53 , which, after declaring that ' 1 o eeclesiastical title of homor or dignity derived from any see, province, diocese, or deanery recognised by law, or from any city, town, place, or territory within this realm, can le valuly createc, aud that no 'pre-eminence or conceive power can lo conferred otherwise than under the authority of her llajesty,' repeals the Ecclesiastical Titles Assumption let ( 14 and 1.5 Vict. c. 60) as inexpelient. The result is, that while no prosecntion can now take place for asssuming such titles, their assump,tion is still treated by the law as an illegal act.
ecclesiastical year. See Yehi; also Date.

ECCLISASATICUS, the title of an aporyphat work, callow in the Septuraint the Wishlom of itsur, the son of siruch. It oltained tha title of E., mot because the writer was an priest (for regasding his profussinn nethins is known), hent becense it was, in the opiminn of the fathers, the chiof of those apocry:phal works which they designatery rectesiastici libni (i. e. books not msiriv, hat which might lee reat in clurch fur the culifiealim of the peofde) to distiuguish them from the canonical seriptures of the old Testanent. E. was originally composel in Aramaic; and the orisimal text was apparently extant in the tine of lerome, who, stites that he
hat seen the fleligew, lut it is mow lost. Ther authen
 but when he tharished is nut lonnwn. Ilis bask was translated intolirenk, with atm introlnetion by his pramelson, who is usually, but mot corretly, snippused to have had the same name als his grandiather.

## EC1IINOCOCCUS，See TAPE－worm．

ECIIINODE＇RMATA（Gr．spiny－skinned），a class of radiate animals，the highest in organisation of that great division of the animal kingdom．They have a ligestive and a vascular system；for the former，however，there is in many of them only a single orifice；a circular and radiating nervous system has been observed in many；they are espe－ cally chatacterised by their well－organised skin，

a，Asterias Tesselfata（Astermado）；$b$ ，Spatangus（ $E_{f}$ huiduc）， or bea－egg．
which in many is strengthened by calcareous plates， and in some also has the additional protection of numerons long spines．Echinide（Sea－mrehins） exhibit these characteristies in greatest perfection． Asteriudee（Star－fishes），Ophiuride（Brittle－stars），

tr，Furghle Primifora（Opheridide），font vipw；$b$ ，dise and part of atm，fromt vew ；$c$ ，hese nid part ot arm，baek view．
primoidter，／1／umbrimite（Soa－slngs，Sea－cheumbers， \＆e．），amd sifmenelider，are also ranked among the le，ind have heen varionsy arranged in orders by dilferent noturalists，Slumes are wanting in most
of them; in some (Hedothurible and sipmentider), there are not ceon calcaroons phates, and thore is no inconsideralde deporture frem the odinary and porfect radiate furm, an :1promh leimp made to the forms of molluses and woms, whilst yot the accordinee with the other $\operatorname{li}$. is very ["rinet in other parts of the organisation. Almost all the E. we free, moving abont at the lootom of the sea: sume of them-at least in an immature state-are stalked aud fixed. They are $\mathrm{l}^{\text {wownided with ':un }}$ apparatus for water circulation," ar peonliar "haracteristic of rudiate animals, and whid 'can semendy be said to exist in any of the other types.' by means of this it is that they fill and fit for nse the suckers or Ambulucra (q. v ) with which most of them are provided, but if which the Simmentide are destitute. The spines as wroll as the ambalaera of the E. are used by those which possess them (Echimide and Ophiurdet as organs of locomotion.The lititish E. are described by 1r Edward Forhes in a most interesting work, crititlen A IIstory of British Stor-fishes amb othor Animals of the Clows Echinodermata (Lond. 1841).

ECIII'NUS, of Sitrmvins, is a classical monlding in the form of a series of eargs, whence it is alse called the ovoln or esg-moublimes. The equs are sometimes divided lyy an anchor or dart, as in the aceompanying example. The type of this ormament is sometimes said to bave heen the chestnut and shell.

## Ediriem. See Viperis Buridess.

E CHO (Gr. sment). Sound is produced hy waves or pulses of the air; when such a wave cumes against a wall or other opposing surface, it is retlected like light, and procreds in another divection, and the somind so hearil is an echo. liven the surbaee of a cloud suffices to reflect sombl, as may le oliserved during thmeder and the discharge of cannou. That the echo of a soumd may return to the 1 wint where the sound originated, the retlecting surface nust le at right angles to a line drawn to it from that point. Oblique walls seml the echnes of a person's woice oll in another direction, so that they may be heard by others, though not loy him. In cirder to celoo words distinctly, the reflecting surface must on the whole be even, or so curved as to resemble a coucave mirror. This last form is necessary for returning a distinet sound when the distance is considerable. A great decree of evenness, $l_{1}$ wever, is not essential, as it is no uneommon thing for the edge of a wood to return an echo. The distance of the reflecting surface must also be such as to allow a sutficient time to clapse between the soumd aud the return of the echo for the car to distiaguish them : when they suceeed too closely, they merge into one. An interval of about $\frac{1}{\square}$ of a second is necessary to diseriminate two successive sonnds; so that if we assume 1105 feet as the distance traversed ly somul in a seeond. $\frac{1}{13}$ of 1125 , or 62 feet, will be the least distance at which an ceho ean be heard, as the sound will go that cistance and return in $\frac{1}{8}$ of a second. If the distance is less, the echo only clouds the original sound, hut is not heard distinct. It is these indis. tinet eeboes that interfere with hearing in ehurches and other large luildings (see Acoustics): hence anything that breaks the evenness and coutinuity of the reflecting surfaces is an improvement in this respect. The number of syllables that any particular echo will repeat, depends upon how many can be uttered in the tiuse that the somed takes to go and return from the retlecting surface. The echo at the tomb of Metellia, in the Compagma, near

In a toatal celipse, the imluntation gens on moreasing till the whele $n$, for a time (heal. bens: after a short interval, the sum rampars again, passing through the same phases of ampor ration in an inverse moler. In an ammine edipes. the whole orth is whemed except a ring or ammaths. Lamar ectipses, again, it is observed, happen allways at full mom, wr when the sum monn are man oqumition, or on "pusite silles of the carth, and are cansed hy the mom passine thromsh the earthe: shamen. Such eclipses aro sometimes parthat, amil sonnetimes total, hat never ammata, and in them gemar phasts they resemble thase ve the sun.
las spaking of celipses, we shall have measion to use artain tems, which we shall now dame. The derution of an ectipse is the time of its cmatimaner. or the intaral butwen immersion ant emersion. Immension (1) incidenee of an eclipse is the moment When lart of the lominary heans to the absume : cmension or exprovation is the time when the luminary lewins to reaphear or emerce from the shandow: When the quantity of an exlipse is nentioncal, the part of the luminary ubseured is intended. Tor determine this part, it is usmal to divile the rlian meter of the orb into twelve digits: and the calizee is sail to be of so many digits, acendine to the number of them contained in that part of the dianceter which is ohscured.

IIaving given this general explanation of tho facts of olservation on which the thenry of extipses turns, and of the langrage emphyed in speaking of tham. We now priceei brienty to explain the theory itself. and how it is Pussible to predict tha time of occurrence, and the dmation and puantity of eclipses.

1. Eclipses of the Mrom.-It has heen said that the". are eaused by the mown passing through the carth's shaduw. bufore this explanation can lee acceptel, it must be shewn that that shalow extemes as far as the mom. This is asily done. Surmanig the earth to have no atmophere, then the shams is the come marlend in shate in tire. 1 , whone anu $x$ is at 0 ; and the drustion is, whether the distance

 assumption that the earth has nu athmipheres. If the assmation were conrect, the earth's shathes would be darlsw and nawnwer than it is, and the fhommena ut eclipses shorter in duration, lat mope straing. The offect of the atmosperie ruftution (son limfladomes) is to homl the rays whinh ate incilent on the atmoshome jn towaris the axis uf the cone of the carth' shathow, thase which fales flumula the lowent strata of the air beime most refracter, and convercing to a pant in the
 of the earth from the earth's entre fecordingly, the monn, whith, as we have stan. chases the slamow at a distance of ahont ef ratii, mever cuters that part if it which is completrly dark thme, whe mel fow her licht enturdy, hut apears if a distinct redible coloner resembiling tamshad
 retraction, in the semp way as the rmbly entur of the dhuts at smanet. There is amother reasor why the phoromena of a lmar eclipso are lens straking thon, from the explanation fiven relation tor tis. 1, might le expected. Very shalow cant by the sumes rays monsarily has a 1 mombra, ir worlupe, mu linth sules of the half-shatow. In the coss lefore ne fing: : summe a come having
 ine ran of them rolectively in its opmaite halues,
 funt in the shated part of the come corc". and wathont the shaw Lanl', a prortim of the sun will
 ing as the print afmanches cither of the lines ath
 Jo. In wther worls, the illmanation from the
sw's rays is only partial within the space refored to, and dininishes from its extreme boundary lines towards the kines EO, E(O. When, then, the moun

is abuat to suffer celijuse, it first loses brightness on entering this penumbra; so that when it enters the real shalow, the contrast is not letween one prart of it in shale and the other in full brilliancy, bont between a part in slatle and a fart in prartial shade. On its emersion, the same contrast is presented between the part in the umbra and the part in the penumbra. What we shonld expect on this geometric view of the earth's shadow, actually happens. From the breath of the pemmbla, it happens that the moon may fall wholly within it before immersiom in the umbra commences; and so softly do the degrees of light shade into one another, that it is impossible to tell when any remarkalule point on the moon's surface leaves the jemumbra to pass in to the umbra, or the reverse.
2. Preliction of Jamur Eclipses.- IVe said that luar eelijses only lapplen at full hoon. They do not happen every full moon, liecanse the moon's orbit is inclined to the ecliptic, on which the centre of the earth's shakow moves at an angle of $5^{\circ} 9^{\prime}$ nearly. Of course, if the mon moved on the ecliptic, there would he an celipse every full moon; but from the mannitule of the anrle of inclination of her ornit to the exliptic, an edipe can only ocem on a fnll mon hapliening when the moon is at or near one of her nodes, or the points where her orbit intersects the eclipic. An eclipse clearly ean lappen maly when the centres of the circle of the carth's shatow anel of the monn's lice apronach witlin a distance luss than the smm of theio apparent semi-diameters; and this smon is very small; se that except when near the bumles, the mom, an whichever side of the ecliptic she may lo, may pass above or luelow the shadow withont enterins it in tho least. The monn's average diameter is known to be $3 l^{\prime} 85^{\prime \prime} \cdot \%$, and from the Noutical Almence we may ascertain its exact amwnot for any home-its variationss all
 As for the diameter of the cirele of the shandow, it is easily fund hy geometric construction inn] calculation, aud is sinewn to vary between $1^{\circ} 15^{\prime} 32$ am? $1^{\circ}$ B1' $\mathrm{Bb}^{\prime \prime \prime}$; and its valu* for any time may be fomml from the I'rutical Almomuc, to which value astronomers usually aud $I$ 'as a correction for its calcula. tion proceeding on the assmaption that the earth has mo atmosphere. Startiny from these elements, it is ad simple problem in spherical trignometry-which may be sulved approximately loy plane trigonometry by sulposing the mon and the earth's shatow to move for a shon't time near the morle in straight lines -ter fix the linits within which the slatow and moon must concur to allow of an celipse. Necollect. ing that the wath's shatow ma the eeliptic is at the appsite end of the diameter from the sm, aml that therefere as it nears ont: mode the sun must appoach the wher-the sum and shamow letine always equi. distant from the "म口usite nomb-we Timp, from the sulution of the almue $]$ whlens: 1 . 'laat if, at the tim" of fall monn, the distime of the sum's centre
 rammet he an velipse. 2. If at that time the distance of the sum's contre from the noarest note low

3. If the distance of the sun's centre from a node be between these values, it is doubtful whether there will be an eclipse, and a detailed calculation must be resnited to, to ascertain whether there will he one or not. Into the nature of that calculation we shall noit attempt here to enter ; suffice it to say that, knowing fiom the Sautical Almanac the true time uf the sun and moon leing in opposition, the true distance of the moon from the node at the time of mean opposition, with the true place of the sun at that time, as well as the moon's latitude, we may, loy means of these elements, combined with the obliquity of the moon's path and her motion relative to that of the sum, not only fix whether there shall le an eclipse or not, but predict its exaet magnitude, duration, and phases. It may here be mentioned, that before the laws of the solar and lnnar motions were discovered with anything like accuracy, the aneients were able to predict lunar eclipses with tolerable correctness by means of the lunar cycle (see Solar Cyele) of IS Julian years and 11 days. Their 1 wwer of doing so turned on this, that in 293 lunations the moon returns almost exactly to the same mosition in the hearens. If she did return to exactly the same position, then, by simply olserving the echipses which occurred during the a.3 lumations, we should know the order in which they would recur in all time coming.

All lunar eclipses are monversal or visible in all parts of the earth which have the moon above their horizon, and are everywhere of the same magnitude with the same leginning and end; and this universality of lumar eclipses is the reason why it is popularly thought, contrary to the fact, that they are of more frequent ocemrence than solar eclipses. The eastern sile of the moon, or left-hand side as wr louk towards her from the north, is that which first immerges and emerges again. The reason of this is, that the proper motion of the moon is swifter than that of the earth's shadow, so that she nvertakes it with ler east side foremost, passes through it, and leaves it behind to the west. It will be readily malerstond, from the explanations above given, that total eclipses and those of the longust duration happen im the very nodes of the ecliptic. But from the circumstance of the circle of the shadow being much greater than the moon's lise, total eclipses may happen within a small tistance of the norles, in which case, however, their Muration is the less. The further the moon is from her noule at the tiue, the more partial the eclipse is, till, in the limiting case, she just tonches the shaulow, aml passes on unobscured.
2. Eclipses of the Sun, so called, are eaused, as we haver statid, lyy the interposition of the moon bstween the eat th and san, through which a irgeater or less purtion of the sun is necessarily hide from vicw. la one sense, a solar eclipse might more properly be callerl an eclipse of the carth, cansed by the munn's slanlow falling upon it.
liy a procuss similar to that used in ascertaining the longth uf the earth's sharlow, it can be shewn that the rreatest value of the length of the moon's shadow is 59.73 semi-dianeters of the earth; at the same time, we know that the least distance of the mon from tha earth is about 55.95 semi-diameters. It follows that when a ronjunction of the sun and menn lapmens at a tiruc when the lestgth of the shanow adod the Gistance of the moon from the earth are, or are nowly, equal to the falues above stated, the 11 mm 's shanlow extomes to the earth and beyond it. Shonlil the shatlow in these circumstruees fill wom the curth, there will be a total mipse of the sum at all plares within it or over which it moves (tig. : i$)$. If j , he the mom, $T$ the earth, ame abla the mom's shatow east by the sun, there

## RCLIISHS

will be a total eclipue of the sum at every peint that is completely within the fortion ob wi the earth's surface. Agrain, the smallest value of the leneth of

Fïg. 3.
the moon's shadow may be shem to bee $57 \%$ semidiameters of the carth, and the gratest distance of the moon from the carth is 6:3'S semi-diancters. Suppose the moou interpesse lintween the earth and sum when these values concur, it is clear that the moon's shadow will fall shont of the earth. In this case, the sma canot lie altogether hid from any point of the earth's surface; but this case, or one apmoximate to it, is that in which there will occur an anmular eclipse. In the fignre, suppose 0 to be the apex of the shadow which falls short of the earth, and conceive the cone of the shadow produced earthwards beyoud $O$ into a second cone Ocd;

Fig. 4.
then from cvery point within the section al of the earth's surface, the moon will be seen projacted as a black dise on the midde of the disc of the sun, the portion unolscured forming a ring or annulus of light. While in the two cases just reseriberl the eclipse is total or annular at places within ab or cl , it will be $\mathrm{l}^{\text {nartial }}$ at other $\mathrm{f}^{\text {laces }}$; the moon will appear projected against a portion of the suu's dise, making a circular indeutation. To ascertain the places at which the eclipse will be partial, we have merely to form the cone of the pemmbra of the monn's shatow in the mamer explained in treating of huar eclipses : at all ${ }^{\text {linaces }}$ on the earth's surface within that cone there will be a partial eclipse. A simple caloulation shews what is the observed fact, that the cone of the pemmilorit is not nearly large enough to embrace the whole of the face of the earth directed to the sum; in other worls, solar eclipses are not unversal, like thuse of the moon, i. e., they are not seen from all places that have the sun above their horizon at the time of the eclipse, which is the reason that though they are of more frequent necurrence than lunar eclipses, the latter are commonly supposal to occur more frequently.
If oue conld take up a $1^{m s i t i o n ~ i n ~ s l a c e ~ f r o m ~}$ which he could command a view of the whole face of the earth turned to the sun during a lumar echipse, the fhenomena which be wonld observe would be somerrat as follows. Marking the point of the earth first touched ly the penamibra of the moon's shadow, be would observe the obscnration sprenting therefrom over a wile and wider area as the pemmbra alvanced, till at last, sulynsing lim to be riewing the case of a total eclipse, there appeared the umbral cone marking the earth with a dark spot. By and by, the Whole penumbral shadow would be on the earth. The black spot would then appear to travel nuwarls with the motion of the slatow, and in its centre, in a conrse determine by the composition of the profer motion of the shadow or moon, and the motion of rotation of the earth. Part of the globe would be free from the affection, and, in the course of time, the umbral spot wont d
progres over difinent pertions of the warth in succession, till at last it lassel off the carth's surface, drawing after it tha gemanhral shalow. "rouk the spectatir anark on the ghane the varions maces aflected thy the shathw, with the ir dearersen shading, he would have a perfect chart of the course of the colipse. The smatl liolt of the globe traversed by the umbra would mark all phaces at which the ectipse woult he tutal, while the dowrees of sharting over places anjuming that lwilt on lwith sides would indicate the magnitule of tho partial eclipse as neen from them. The breadth of ihe: 1selt traversed ly the umbri, when the sun's distume is greatest and the mom's least, is estimated at alont 1 so miles; and in the same case the penmmina is estimated to cover a circular space of 4900 miles in diameter, the eclipe bappening exactly at the uote. If the eclipse does not harpuen at the more, it is clear that the axis of the shadow mast be inclined to the plane of the ecliptic, that the shanlow will le cut ollignely, aul therefore that the part of the earth in shale will be oval. It may here be stated that astronomers nsually calculate beforehand the motion of the shadnw over the earth's surface, and prepare charts to exbilit its motion. Such a chart an observer from a position ontside the eath would lave it in his power to make from oliservation.
Of the commoner phenowena attending an eclipe of the sun, as regards the apporance of that huminary, nothing need les said; they are perfectly analogous to those of lnuar eclipses, except in the case of the eclipse being anmdir. There are other appearances, however, attending an teclipse of the sun, especially wheu it is total, that are very remarkable. The almost instantancous darkeming of the ont of day, more particularly when it is unlmaed for, is calculatel to imporss a slectator with vague terror : even when expectod, it fills the minel with awe, as a demustration of the forecs mul motions of the mechanism of the universe The sulden dark. ness, tor, is impressive from its stranmurns as much as from oceurrint ly day: it resemblas nerther the darkness of might nor the ghom of twilight. The cone of the mon's shander, thoug it completely chrelopes the spectator, docs mot, as we have explamed, cenclose the whole atmosmare alowe his borizon, The wass of menclused air accordingly catches the sunlight. ami refleets it into the region of the total welipse, making there a peculiar twilight. Stars and plancts appear, and all animals are dismayed by the dismal asprect of nature- - See Mahond-Bey's Report of the Total Eclipse of July 1560. Mr Warren Dela Inu, who was me of an expedition of selentitic men who went to spain to wituess the sanmerifise, gives the following accomnt of the aspects of nirture near the time of tatality: -When the sun was reducel to a small crescent, the shanlows of all objects were mepicted with great sharpuess and hatkness, remindint one of the effects of illmmination with the electric lyint. The sky at this period assumed an intigo tint, and the landseape was tinged with a lromze lue. - Althonum, 1460, vol. ii. page 259. At totality, there was still light enough to enable the obserrer to draw without the aid of his lamp, while the sky near the sun presented a deep indigo, and thence passent through a sepia tiat to red and brilliant orange near the horizon. It must be saik, however, that the strange appearance here recorded is exceptional, and probably unt such as cuuld ever occur in our latitude. There is one set of phenowena attending total celipses of the sum, which are at once strange and invariable, and the causes of which camot he said to lee properly mulerstood. As long as the total echise lasts, there appears ronnel the sun and mwo a luminons corona,

## ECLIPSES OF THE SATELLITES-ECLIDTIC

as in fig. 5, while lefom the corma anmar very alpheal in the case of lumar ecluses, At the time of

 the urnhe, or if the latitule of the mern, vinwal fom the "arth, exceds the sum of the apparent scminimenters of the sum and memm. When withm these limits, it is a problem of mombers and of spherical trimbometry tor ascertain the nature of the ertiges, if any, which will harpen.

The number if colifoes of the sum and munn thene ther in a year camot be less than two or more than seven; the most nesual manlor is four, aud it is rare to lave more than six. The explanation of the linatation of tive number of ecclipses is commected with the fact, that the sma passes lis both nodes lont ance in a year, exent in the case of his passiug one carly in the year, in which case, owine to the recession of the moon's norkes. he will apain bass it a little before the end of the yeitr, From the smallness of the come of the mom's shatow, tutal solar eclipses are extremely minerpuent in any one flace, comparel with the frequency of their actual wemmence. At Paris, there was only one tutal eclipse of the sun in the 1stli c., that of $1-2 \pm$, and there will

We no reason for donleting that they are constant attembants on eclipses. They wore lately observel during the celipse of $1 . S$ th $\mathbf{J}^{\prime}$ ly 1850 , when their aplearance was such as to exchule the motion that they are due to inergularitics in the mom's surface. Several muthorities are dis?used to refor them to the beighter portions or fawise in the sun's surfare (sce Scx) ; aml Alr the la lire ohserves, that the smens mataion in the comrse of the two days succeeding the uclijse limplit to view faculle, that at the time of eclipse wanlil have jnst acempand the pasitions at which the prominences alpmared.

## ECLIPSES OF TUE SATELLITES.

## Sitellites.

ECLI'PTIC is the name given to the great circle of the heatens romal which the sun sions to travel, from west to cast, in the comrse of a year. It touk its name from the early ohserved fact, that colipses happen maly when luth lowhes are in or near this path. A little attention abont sunset or sumise shews that the sum is constantly altering his position amony the stars visible near him, leaving them every day a little further to the west; and that this motion is wit exactly east and west, or parallel to the ennator, lwemmes also exilent by observing that the sun's howht at mind lay is constantly alterimes. It is further whersel that. twice ar year, abont Namb 21 and september 23, the sm is exactly ont the cyuator. The two prints of the equator on whiel the sun than stamls are the equinoctial puints, and are the intursections an the equatom anl ecliptic. Again, there are two diys in the year mo wheh the sun rearhes his preatest aml his least mid-day clerathan: the lirst is the "Ist of June, the seciond the 2lst of lwemblr. Wh these days, the sum has reached his oreatest distanee from the ergatore either way, ant the paints in his conrse where he thus semesterman or halt in his retreat from the muatur are fallent the sulatices (wolis shetionter). These four fuints:are hastant from ome amothor by a quatrant of

It has berna callofltad that it wats at

 alterations eamot sensilly affect the semwns.
'The physical canse of this change of the ohliguty is the action of the other phats, "rpecially faniter, Stars, and Venus, on the mass of the reth. The fact of the change was kmon to astronmers in wry ancient times; Hermintrs mentions an wh tradition af the Egyptians, that the ecliptic had formerly been perpendicular to the equator-a notion into which they were must [robobly led hy olserving. for a long series of ycare, that its cibliquity was constantly diminshing. There can be litthe chath that the Challems arrivel at the cpoch of $40: 0,001$ years lefore the entry of Alexamder int, lablaym, to which they proully referred for their tirst astronomical observations, hy componting the time whou the ecliptic was perpendienlar to the erpator, on the supposition of its alliguity diminishing $I$ in lon years. Though it was mot thll after the discovery of the law of gravitation that tha change on the ofliguity couk he explained, yet that it was elanging was belicved in hy many astrommers, although some domited whether the differences in the values at difleront timos were not due to crrors of ulservation. The earliest known mentare of the oblinguity of the ecliptie was made ley Teheou Kong, the regent of China. Amony the westem mations, the earlipst measurements were made by P'ytheas and by Eratosthenes.

ECOLE POLITECIINIQUE is me of the most celebrated military acalemies in France. In 1793, all the mulic estallishments in l'aris were in a convulsed state, owinr to the liewhation. In 179., M. Lamblardie, elirector of the Ponts et Chenssies, proposed the establishment of an Lcole Centrale des Tramar Publics, to elduate ymug men for military, naval, ani civil enginering. Stonge and Carnot favouring his plan, it was carcied out, and a school estaldished at the l'alais bomomen. The first list of professurs comprisel names which afterwards acquirel Eumpean celehrity -including those of Lagrange, Prony, Monge, Hachette, Hassenfratz, Fonreroy, Taugutlin, Berthollet, Chantal, Pelleticr, duyton-Norvean, and Merimé In 1795, the name was chauged t.1 E. I'. ; many alterations were made in the organisation ; artillery studies were included in the course; and the pupils were ordered to wear a uniform. When Napmern went to Egypt, th purils from the E. P. accompranind him, many uf whom greatly distiaguished themselves. Napoleon made the organisation of the school more strictly military in 1814, t. identify it more fully with the army. The school was dissolved in 1s10, again in 1830, and again in 1832, on account of the impetuous way in wheh the pupils mixal thems.lves up with the political disturbances of those years: lut as the school suited the military frnius of the French nation, it was re-established nin earh oceasiom, after the restoration of trancullity. C'andidates

ECSTASY (ir , Rostasis, a transmition, a change of situation or comdition ; apdied to the mind in the semse of a state in which it is altered or fundamontally clanged in maracter hy some absolinge (mmomi), a whal apdied to these states of mind, which, withnut ammonting to Insanity (.|. r.) , in respect of the temparary bharatur of the affection, are marked ly mental alination, and altered or diminithen ennscimsness. A persm in erstasy may he vinlently maver. "or ompletely masibe; convulsed. or righ. or thaced in all the bmos; silent, or uttoring ummenins or excited lansage. or assmonge the character of a prophet or inspired pran; having, or nut lavine intellizence of what is sumer on aromel him. The varintins are infinite, lecause this morbid state of the mind is nothing more in rality than the tixing of it in a parti. cular attitude, as it were, in connection witl an
overmastering iden, emotion, or sensation, which causes all other external phenomena to be dis. regarderl. Perhaps the most common form, ar, at all events, that which is best known, is religious ecstasy, closely allied to monomania and religions delusion of every kind; often simulated, but also occurring as a real disease, as in the case of those "struck' in revival meetiugs, and in the older histories of the conversions of Combuslang, the conmulsiomaires of St Medarl, and the epidemies of religious excitement mentioned umder Dancing Mamia (q. v.) It is also common to speak of the esstasy of terror, and the expression is correct in exacgerated cases, where fear completely paralyses 1 ooth the conscionsuess and the power of motion and expression ; so also there is an ecstasy of joy, of love, of hate, of meditation; and in some physical Etates as Catalepsy (q. v.), Hysteria (q. v.), Mesmerism ( $q$. v.), a true cestasy is one of the phenomena, inasmuch as the proper conscionsness of the individual is temporarily abolished, or so much changed in character as to lead almost to the loss of the sense of presonal ictentity. Some of the cases of preswmed Double Consciousness ( $q, v$ ) are no donlot of this kind ; and generally the same may be said of the state of the mind in many dreams and visions, and also in Somnambulism (q. v.). A striking picture of this form of eestasy is the well-known sleep-walking scene in Mactoth, where the lady's unind is so completely preoceupied with the supposed bloolstam on her hands, that thongh her eyes are open. we are told that 'their sense is shnt; and the mind is also excluded from all the ordinary arenues of communication.

ECTOZO'A (Gr, elitos, without, and zoos, livinc), a term which has been introduced, as in eontradistinction to Entorou, to designate those parasitic animals which live upon the extomal parts of other animals, as lice, ticks, \&c. Such also are many of the entomostracous crustrecans, parasitic upon fishes. It is a question of mucl importance. not yet satis. factorily answored, if any of these creatures are the causes of disursed states, in commection with which they are sometimes fonm in particular abundance, or if their presence in musual numbers is to be ascribed to disease previously existing.

ECTRO'PION (Gr. A, and tropo, I tum out), an everted condition of an eyelid, in consequence of which it does not corer the globe of the eye. It is apable of being remedied by a slight surgical upration.

ECTROTTC (from Gr. ectroma, abortion), a term appled to mothois of treatment which aim at preventing the derelopment of a discase.

WCTYPOGRAPHY, a method of etching, in which the lines are rused on the plate, in place of being smakinto it. See Ercman.

DCTYPUM, a cast in relief of am ornamental design. framluced from a mould.

SCUADOR, the Simish term for E'fuator, is the name of that fragment of Colombia (q. v.) which lies un both sides of the equinoctial line. In lat. it "xtends from $l^{\circ} 40^{\prime} \mathrm{N}$. to $\sigma^{\circ} 50^{\circ} \mathrm{S}$, while in W. long. it stretoles from $69^{\circ}$ to $81^{\circ} 20$. It measures, therefore, from north to sonth fully 501! miles, and from east to wost nearly som, presenting an area of slunut : $\because$ on, ono symare milos. it is boumder lsy Now Granala, Brazil, Pran, and the Pacilte. Finward the "ast it is ? ?raned by the Amazon, which recosocs all the rivers that fall down the -iblem sidnas of the Andes, while the country wont of the. Andes is drainod rhefly loy the Nira,
 strean lebing more available for mavigation than any
other on the same const of South America. The emontry is traversed, nearly in the line of a meridian, by the two ranges of the Andes, which, alternating between union and separation, sometimes run into what are called knots, and sometimes enclose, at great elevations, plateaus or table-lands. Among these last, ranging from sonth to north, the most important are those of Cuenca, Hambato, and Quito-their respective heights ahore the sea being, in feet, $\$ 640$, $\$ 860$, and 9543 . Lofty as these plateaus or table-lands are, they are leset, nay nlmost shut ont from the world, by pinnacles of occasionally more than equal altitude alove their own level. Of these the most remarkable are Chimborazo and Cotopaxi (q. v.). In connection with these physical features, the country is suljeet to volcanoes and earthqnakes-the latter frequently occurring, and the former numbering altogether $n 0$ fewry than sixteen. The elimate comprises every possible variety. Hyperborean cold marks the smow-capped mountains: a temperature at once molerate and uniform renclers the upland plams so many paradises; while, on both sides of the dividing ridge, intense heat oppresses the lower valleys. The rainfall is different im different localities. In the basin of the Guayaquil, there is regularly a wet seasnn; between it and Cape San Lorenzo, almost perpetual drought prevails; and, in the other direction, the upper tributaries of the Amazon are said to be fed by almost perpetual rains.

The population is ahout two-thirds of a million, pretty equally divided, it is believed, between Spaniards, Alorigines, and Mestizoes, with a very inconsiderable admixture of Africans. The chief cities are Quito, the carital, and Guayaquil, the emporinm of foreign trade; and the towns of the second class are Fiubamba, Puno, Cuença, and Loxa. The government appears to have been constituted on the morlel of the United States of North America, having a president and vice-president, with a senate and a house of representatives. The external commerce is slowly but steadily advancing. Between 185:3 and 1858, the imports had increased from $£ 309,180$ to $£ 506,456$; and the exports from £3U4.385 to £474.32t. I)uring the same interval, the British ressels-both entrances and clearances taken together-had multiplied from 22 to 82 ; beimg, at the elose, fully one-half more numerous than the ressels of all other nations beyond the limits of Spanish America. In 185S, the principal articles of import, in order of value, were cottons -nure than a fourth of the whole-woollens, wines, spirits, groceries, soap and candles, hardware, Homr, linens, \&c. In that year, the chief heads of expurt, also in order of value, were cocon-abont 55 ber cent. of the entire amonnt-the precious nuetals, timber, bark, hides, orehilla, tobaceo, \&c.

ECUME'NICAL (Gr. oikonmenikos), i. e., universal, a torn applied to ecelesiastical eomcils, regarded as representing the whole Christian Uhurch, or the church of the whale world (oikoumonet, and to the orthonox or Catholic Church, requded as opposed to berotical amd merely local sects. The Kommen ('irtholies clam the designation as appropriate to their own churel. It is a title of patriarchs, archbishous, and meclesiastical superintemdents of 1 morinces

EC"KE.M A (from it (ireek verb, 'to boil ont'), an eruption of small vesieles on various parts of the skin, usually eroweled torether, with little or no inflam. mation aromul their hases, and unaticnaled by fever.

I'DIDA. There are two works which bear this title-thr Filder Sirmundar hims Frorla, or Edda of Sumumd the Wise, and Snorri Sturleson's Edela. 'The formor and uhler of these is a collection of the most ancient mythomgical amil heroie Scandinavian

## EDEN-E1MFOU

Komah in Tabymia, mot far from the Porsian finle; Benlant, Cahnet. Hales, Faler, J. Jyesmith, in favomr of Armenia, bear the stmores if the Thers and Euphrates: Le Clerc, in favour of the reginn near Inmasens: while the mulem (ierman schoul of Mondical critice, comvincel that the Hebrew accoment is traditional, and, in its present form, of very late composition, and inpressel, hesiles, with the vast antipuity if the far East, lave. almost without excepticin, turned the ir eyes in that direction, and sompht the cralle of the human race in bactria or Cashmere, or the region lying to the north of it, a bart of which is to this clay called Aurlyana, the "(imakn.' It may also be mentioned that the Hoham. matans lutiove Eten to hase been in we of the soren hearons-some say the mom-ami that the "upulsion from paratisu comsisted in Alam being east thwn unn the eartla after the Fill. It is useless secking to idontify the river-spstem of Eden with anything kmown at jusent. There is no river on the face of the gholne of which the Luphrates and Tigris (Hiddekel) aro scparate "deals" (whe ther this mons "somrers" or "(hitmels") as they are said to bee in the ed chopter of crencsis. for, as Major Rennell has whewn, althouch the Euphrates ami Tigris nou unite for at shost sare on their way to the Persian (inlf, yet, whtil the time of Alexauler the Great they kept entirely distinet comrses; and thorefore it has luen assumed that the Deluge' completuly altered the phrsical character of the region denutat lay the term Elen. This was Lather's motion, to which, how ver, it has been oljecter, that the narrative in Genesis is so worded as to convey the iflea that the countries and rivers spoken of were still existing in the time of the historian. bosides, the science of genhery has thronm so much doulat on the miversality of a Doluge so late as the perion assigned to Suah, that it is hazardons to argue on the hyputhen of any extensive physical change having taken place since the tirst appearance of man un the planet; at least, if that le dated amly sme six thomsind years lack. It will thas be seen that the questan of the lowatity if Elen, or of the bate sense in which the Mosaic marrative is to le mulerstomi, is involved in inexplicable mystery; and it has locome a general "pimim, that the spiritual signitionace of this primeval story is what jrineipaly concerns "laristians-an "pinion which drives force from the total silence of the New Tentament in refarence to the subject.

EDEN, a river rising in the east of Westmore. land, in the lemme Cham. It mons moth-morthwest throug the east of Whestmondand and fomhurlam, past Aphly and Corlisle, and ends in a fine "stnary at the urper part of the siolway liorth, after a cousse of 6.5 miles.

EDESTATA (Lat. twothess), an orter of Mummotire establishel hy cuvicr, and generally ruceiven by maturalists. ("urece remarks, that "althomb, liment thenther hy a purdy negative character,' the E. hase, mevertheless, "sume jusitive mutnal relations, particularly in the great claws which conempass the enls of their teres, mind which more II 10.88 athmaimate to the mature of hoofs alse in a certain slowness or want of a uibity, olviously ariving from thas peraliar orcansation of the er limbs.' H1. induled amons them, however, the Somorrumbt, which, allumbh so few in mumber,

 Whate torme them. The remaning E are divided

that are absublely destitute of tecth; lout none of the urder have any tecth in the forepart of their jaws, and their teeth are comparatively imperfect in structure, leing destitnte of mamel and listinct routs. The slnths alnme sulsist on vegetable fool, the rest chiedly on insects or on animal substances in a decaging state. The whale mumber of existing species of E . is not wreat: but they aprear to have been more monerons and of mach greater size in a fumbr sendural perind, as the remains if the Mgloulon, Metjutheriem, and Meyelonye testify.

EDE'SSA (modern name. Crfuh, or mfin), a very ancient city, on the river Disan, in the morth if Mescrutamia, is miles sonth-west of Diarlekir. althongh the Christian or Mohammetan legem, ascriling its fumdation to Nimrol, or Khabiba, a female contemporary of Aloraham, is mworthy of any melence. With the conquest of Persia ly the lireeks, the history if E. first hecomes clearer. ridulus in praticular, is said to have dome mach for the arcramlisement of the city. Christianity was intrmlucer into E at an carly perimi. In the reing of Trajan, the place was made tributary to lime, ant in olf A.r. lecame a Foman military colmy, under the name of Colonie Marcia Edeseforim. During this periml, its mportanee in the histury if the Christian Church eontinnerd to increase. More than 300 monasteries are said to have heen included within its walls; it was the seat of Myhraim Syrus and his school, and played an imp:rtant part in the irian and other controrersies, With the extension of the religion of Islam, F. fell into the hands of the Arabian califs. Christianity dechmet, aud wars at home and abroad during the califate, destroyed likewise its temporal splendoar and prosperity, till, in 1040, it fell into the possessinn of the Scljuk Turts. The Byzantine empernss succeedel in recovering $E$, but the viceroy contrived to make himself independent. He was, however, hard pressed by the Turks, and this renderel it easy for the crusader. Baldwin, the lrother of Gomfrey of Bonillon, to gain possession of the city (1097 ans), and make it the capital of a Latin principality, and the bulwark of the kingflom of Jerusalem. Under the Frankish princes, E. held out valiantly against the Nlussulmans, till at lensth Zensi, ruler of Hosul, succeeded in taking the thwn and citalel in the year 1144, when all the Christian chuches were eonverted into mospus. An attempt made by the inhabitants to) throw off the 'lurkish yoke, completed the ruin of E.: the Eilessems were defeated by Nur-ed-din; and all who were not massacrel, were sohl as slaves. After many vicissitndes, in the course of which $E$. furl] successively intu the hamps of the sultans of Lespt, the Byzantmes, the Mongols, Turkomans, ani Persians, the city was finally conquerel ly the T'urks, met has ever since formed a purtion of the 'Turkish dominions. It now contains 40,0 ot juhabitants, if 3 lom 200 are Amenian Christians; the rest are Jouks, Aralimens, Kurds, and Jews. At present, li. has mumerons mospues and bazarss; mamufactures of cotton gooslo, Lrulismiths' wares, and movero leather, commere in bratish manufartures whamed by way of Aleppo, and a large trate in "m, \&e, with syria. F. is regarded by the Fastums as a samed city, lacanse they believe it to hate luen the vesideace of Abrabam.

EDGiNGS are imbispanalle to meatness in gardening, excegt where farteres are cut nut of a lawn, lint more especially to separate graved-walks from cultivaterl gromd. They are sometimes made of stone, or of deal; sumetimes of ornamental whekerwork, and now mot unfrequently of wisenork; bint for many purpuses, the lust chtings are fomme of low-growing everereen plants, anl mone are so common in lritatu as those of dwarf lox, which, when earefully trimmol, are very florsing to the eye, amido mot renime renewal for a number of years. Thiff or sumpink is another not uncommon edginar, is beautiful at all times, aml partienlarly sh when in tlower, but requires frequent renewal. The double daisy, oftom planted as an ealyine, alsa ropures freguent renewal. Turfongings are sumbtrmes emplased for wide dower-bonders.
 sWalluWs' NEATS. See Nuste, Emble.
EDICT (Lat, dic'um). The power of making
 masistrates at lime: hat it was liy the cumbe maldes, and more extencively still by two pretorsthe pretor urhanus, and the protor perominnethat it was prominently exercised. In a province, the jurishliction of the prator passed to the prases. As this puwer was eo-extensive with the prossessinn of what were called the honours (homor,s) it was frimuently spoken of as the jus homorarium; and from its leines "xomed cbietly ly the prators, it was also known tas the jus matorium. The elicts of
the prectors ase mentioned by Gaius amons the sinures of the Roman law; lint, strictly speaking, they are to be considered as rules promulated liy the maristrates on entering on oflice, rather than as expressions of the will of the Roman perplu, either direct or imdirect. The edict of one prietor was mut biniling on lis successor, but very often edicts were arbopted and confirmed, and this came cradually to constitute a very important boly of law. They were freguently known by the names of their birst promulgaters, though they were often named with reference to the formula and the actio which they establishea. The power of promalgating eaticts is supposed to have flowed down from the lings to the consuls, and through them to the praeture, and thus to have formed prart of what we shomald call the royal prerogative. Even in Cicero's time, the stuly of the edict had become a regular lranch of the study of the law. In 67 r.c., the Lox Cornclia proviled against the abuse of passine edicts for the decision of partienlar cases by rerquiring the prectors to decile in emanmity with the edicts which they promulgated with reference to their whole temure of office, which were known as perpetnal edjets. Servins Sulpicins, the friend of ("iemro, admessed to Bratus a work on the subject; and Ofihs male what was problyly a compiation of the various edicta, rescmbling the sulsequent ane by Juliau. The olject of the edict, acenting tor the limman jurists, was to aid. supplement, and concect the cisil law, and to remler it mare conducive to the public service, and they speak of it as 'the living roice of the civillaw.' it was, in short, an indirect form of legislation, which pulthe opinion had sanctioned for the pullic convenieuce; and there can be mo doulot that it contributeal what was nltimately the post valuable prart of the lioman law. There were many commentators on the edicts numb the emperors, amongst whom Labeo is mentimed and cited by Ulpian (Dig. 4, tit. 3, s. 9). . Inlian is supposed to lave colbecterl and arranged the elicts, and given to them a systematio furm. Gains, Ulpian, avil Paulus compused treatises on the alicts of the curule atiles; and it is chietly from the writings of these ant the wher jurists excerpend in the Ifigest, that we know anytling of the character of the edict, the portions of it which have been preserved being mere fromments. They have been callected by Wieling in lis Frugmenta Edicti Permetui (Fravk. 1733).

## EDilet of NANTES. Ste Naxtes.

EDICTAL CITATION, or INTIMATION. By the famer practice of seotland, where the party to he cited lefore a civil court was out of scotland, the citation requived to be given ly a messenger-atarms making proclamation at the market-eross of Efinlmog, and at the pier and shore of Leith. The inea, of comrse, was, that the fact was thus more hkely; to reach the absent party than if it hat heen intimated or pmilished in any other manner.Erskine, 1. i. tit. $\because, \mathrm{s}$. 1s. Lint the practice in this matter was alterel by the so-callod bulicature Act ( 6 rion 1 V . c. 120 ), amd the subseynent statute, 13 aml it Vict. e. 3 fi, s. $2=$, which macted that services acainst persons forth of sontland shauld be done by delivery of copies at the remoll offine of the keeper uf the records of the comrt of sission.  Fhef town in the cominty of Mil-Lathan, weenpios

a distince of about a mone and a halif from the Firth of Forth ( $1 . v$. .), which is here almot six miles in luralth. The outskirts extend almost to the share, and a commection has thus been formeal no the narth with Leith, the ancient part; Newhasen, a fishing village; and Granton, a monlern and risinf port. The adminable pusition of E . has induced the comparison with Athens, from which, as well as its literary fame, it takes the title "Modern Athens.' The Gaelic name of the city is 'Dunctin.'
The castle, which crowns the highest point in the city, was unloultedly built first, a town gralually forming on the top ani siles of the rilge, which slopes downwads to the east. For some centuris the city was confined entirely to this ridge or hill, and was flanked on the north by a lake or marsh called the Kor' Loch. The remaining means of defence was a wall lmilt by the citizens alont the milille of the 15 the century, a few relics of which, of different eras, still exist. E was therefore a fortified town, protectal by the castle at its western extremity. When David I. was induced by his piety mul manificence to found the Alibey of Holyrond in the low sround eastward of the city, he at the same time cmpowered the camons of this religious honse to fonnd a burgh in a westerly direction twwards the city of E., and thus was built the Canomate, afterwards mited to the city: The beautiful ahbey itself has been a min since the fall of its roof in 176s. In connection with the albey sprang up the palace, which became a farourite alonde of the scottioh sovercigns. Not, however, till about the era of the muriler of James 1. at Perth in 1437, did E. become the recognised capital of the kinglom. Neither Perth nor Some, staling nor Dunfermline, heing able to offer to royalty security against the desions of the noldes, E. with its eastle was thenceforth selected as the only place of safoty for the royal househoh, the parliment, the mint, and the rarious important government offices. By this means rising in anportance, E became densely peopled, and the houses were built to an musmal height, that the iuhahitants might keep within the walls for the sake of protection. The torn then consisted of the original main way callet the Hlich street, reaching to the fanongate, and a parallel was, narrow and enntines, on the south, called the Cowgate, connected with each other by npwarls of a hundred narrow cross alleys or closes, between dense chasters of honses. Must of these bonses consisted of a succession of thors or flats, each being a separate dwelling ant of such floors there were selloms fewer than six, and sometimes ten or, twelve towering to an immense locisht, and rendered still more inposing from lemg built on an eminence.

The citizuns remained content with these ennfined limes till abont the minale of the 18th centary. betwenn 1763 and 1769, the Nonth 13idge was erectorl, comnecting the oll city with the fiells on the meth, or which the Now fomen was leminuing to be hult. Shorty afterwaress in 178S, the lime of this hrider was extemind suthwaris by twentytwo arehes (the sonth bringe), only unce of which is socul whor the strueture spans the Cowgate, and thas a low way was "lemed to the sonthern suburlas, "himithese since rivalled the new town in raphd grow h. Campe the Fourth's bridge was "reeted ower the same ralley a slowt distance to the Westwout, a consilemble time afterwards. The Nor' lowh was drainel and partially haidsed over ly the Alomad formed from the rarth dueg from the formedathons of tha now town, and its sitnation is aceppiow ly fine public and private gravens which now he in the contre of manden be, and separate Princes Nit reet. the senthmust and mast pheturespur strent of the

new town, from the uld town, Two retherp lupleres

 strecet ennl the fialtom llill to the eost ; and at the west end, the tine lean lindera rave tha

 hats beron emmpleted by the milway emapraty, natu to and parallel with the North Brilere 'Jhes now town beras built with musla remulaity in straight strects, and in spuares and eroseonts with munerous emadens, contrasts with tha crowdial, thongh pincturestuc masses of the oht town. 'Phat
 town, and the mecessitios of sunitary anmeliont tions in the wererowdeal buildings, have wemponed great chaneres of recent years, and serveral hew strects have been opemel mip throngh the most crowded and rumans localitios.

Altogether built of durabla sumbtome froms guaries in the neirhborlourl, the wemeral aspect of the houses is that of great sulidity. Amons: the most intrresting fatures of the town are the Castle, in which are shewn the ameient restia of Scotlame; the l'urliament Jlomse, used fiy tha Scottish parlitment before the Unim ; Sit files's C'athedral, unw hoing restores, with a magnifiecont erown over the transept; the Ablrey and l'aliwe wif Ilolyraol ( $1 . v$. ) : the Jank of Sectland, recently relailt ; the Koot Hommment, desimad by a native sulf-tancht artist; IEriot's (q.v.) ame lomalllsm's (o.v.) Iluspitals; the (General lierister Honsce, where all horitable titles and state docomonts are recorded and pressreal; the Pastathece; the linyal Institution, where the lioyal sueiety, and the suciety of Antipuaries of sentland, meet: Nationall fallery ; the Taiversity and Musemm of Seronere and dit: the equsconal churches (St Jotu's and sit l'anl's) ; and the banks, clubs, insuranee offiens, and botels of Princes Street and George Street. The untinished National Nommment on the ('alton llill is striking from its pusition. A new eatholrat, and a spacions new infiomary, are being built. The comatry romel E . is thely varied. From Arthor's keat and Salishary Grase, in the sonth east, the eye wanders to the limal Jills on the south, and the richly womled Cirst orphine Hill on the west, all within a mile or two of the town; while further off lowin the Pentlame Jhlls, fomur miles to the sumtheenst; and to the north the Firth of Forth, and the Fife const and hills, form a marnificent backeromml. The elimate is bracing and healthy, althoneh the silnotion is expmsea, not so much min falling as on the west coast, and high winds are very purestent.
E. is not an important manufacturing tuwn, though it derives considerable connmeveral infortance from its various banks and insmrance offices, round which restlve no mean portion of the monetary capital of Scotland. The principal inulustries are brewing (two-thinds of all the ale or lieer lorewed in seotland being made in or near E. , pinting and publishing with the kindred arts (sce look-1ratae), distilling, ironfounding, tanning, and condmbilding, mandacture of artides in indiarabler, of lomse farniture, and of jewellary, and the rearing of yomme trees in murseries in and around the town, for which the elimate is favorable.
$E$ is tha plate of resilence of considerable mombers of the xoottish landed grontry, and its society is regarded as musually polished from the predominance of the professional and literary elements in its compositim. 'This arises partly from it: being a mavernity town, and partly from the presene of the Supreme Law (ourts of Scotland (sec (oldeaf: of Jostre), all the important lemal business lieing attracted thither on tiat aceount;

 androcates (hamisters), wioters to tho signet, and

 high-class instruction at moderato dareme for abrat
 of resilents besimons of availner thamsalves on this brom. L'or the porrer lassos. pirt of the commons fonds of tienreq Il rint's charity have leeen disatmal for chaper schowly thronthont the town. F゙attes G'ollege is a fommation selmol on the mombel of Linctiy and bitom, aud is a handsumbe edifide.
E. is larately resunted to by visiturs tor thes Highlandes of teothand, and has an umasmal momber of
 ammsement, imelmhats atare ofers-air of mansimm. In the sonthenn merirns are dine open links on downs, where the gatate of (andf fro v.) hats been played forn time immourial. Exembant street mals are tos be fomm, and tramways are liad to the summes.
li. is the seat of varions seottish Boarels
 Northern Lirhthomses, \&e): in it tho listalhisheal and pree chnorches hold their anumal assembless and courts, as d., the lnited l'resbyterians.
E. is a rosial bursh, governed by a towneromeil compresed of 41 manhers. The town-ennmeil elects from its own berly a Loml Provist and six bationg who constitnte the civic magistraey. E . is rever sented hy two members in pratiment.

In 1821, the pur. way 112,235 ; in 1881 , it was $167,53]$; aml in $1571,196,979$. Number of inlatite honses, 10,529 ; parliamentary aud manicipal constitumey, 24, $\%$,

EDINBULIUII, The USIversiry of, toml its rise fron a berpest in 1505 by Liolnert Jeml, lbishup of Orkney, of simo merks; lat the sum was retained for a considerable time loy the dibnt of Kinloss. The masistrates of the city, on the faith of receiving the bequest, purchased in lebi: in portion of the gronmi on which the present miversity stinds. Qucen Mary was anxioms that the proprosed institution shonld sucemal, and bestowed ung it irrants of confiscated chareh property. The miversity was formally fommed lyy Jing James Vl, in lose by royal ehartur, in virtue of which the corporation, upithlass, remamed its patrons or governors. In 15s: the work of instrmetion began under Pobert Rollodk, the first regent. Orisinally, the umiversity consisted of fut one class and one regent or teachel. The regent had charge of the stmatents from their enombent to their laureation at the elose of tho fonth session of stuly. As the university prospered, additions were male to the stall of regents, and separate chairs for the several branches were fumadet. In the begianing of the 17 the c , the Scmatus Acalemious consisted of a princibat amb four reorents. "The dirst theolosical chair was instituted in 1645 , and the first profesmer of metheine was appointed in 168. After 16iss, the miversity of E , along with its sister universities, was sub. jected to a parliamentary risitation. The commission was issmed in 1600 , an it the close of the century the maversity was muler its enatrol. Ioder this supervismon, a soparate chair of troet was estah,. lishod; and after lios, the present arrancoment of

## EDRIOPHTITALMA-EDUCATION.

Ilumea unde: Jewish sway. The people were compelled to conform to the laws and customs of their conquerors, and the country was for the future ruled ly Jewish prefects, one of whom, called Antipater, who was born in the country, acquired the friendship of the Ioman emperor, and was appointed procurator of all Judea. His son was the famons Herod the Great, 'king of the Jews.' In the 7th c. A. D., E. was orerrun by the Arabs, and has ever since shared the fortunes of Aralia.

EDRIOPHTHA'LMA (Gr. sessile-cyed), a section of the class of Crustaceans, consisting of those malacostracous crustaceans which have the eves sessile-not mounted upon stalks. They also differ from the other malacostraca in having the oreans of respiration connected with the argans of loconution; some of them, which constitute the two orders Amphipola and Lermodijolle, having the respiratory organs comnected only with the true or thoracic legs, whilst in the remaining order, Isopode, they are connected only with the abdominal or false legs. The E. are generally marine; many of the

Elriophthahas:
1, Caprella phasmi ; 2, Cyamus Batenarius.
Amphinode, however, are inhabitants of fresh water; some of the Isoporle-as the armadillo and woot-lomso-are terrestrial, but are inhabitants of damp, flaces. Many both of the marine and fresh-water species spend their lives rather among the weeds and decaying matters of the shore than in the water, to consume these being apparently their office in the system of nature; some have organs alapted for leaping and for burrowing in the sand, as the common Sandhopler (Talitrus locusta), one of the A mphipote, of which countless myriads are to be seen on all our sandy shores, attracting the admi. ration even of the most careless; some burow in more solid sulstances, as the Limnoria terebrans, one of the marine Isopoda, which too frequently effects the destruction of piers, dock-gates, \&c., perforating them in every direction. Many of the W are parasitic, some of them on whales, some even on prawns and other crustaceans. Some of the parasitic F. are destitute loth of eyes and antennar.

EDifisi, Ahe Abmaldif Mohammad bue

 Lomjata (Fotre's), one of the most eminent Arabic cracraph re, and a lesecnitant of the royal family of the Blrisites-who traced their origin to Mohammoll himself - was horn at 'euta or Silita (Civitas) in the yar 1099. He stadied at Cordova, and earty ditinguislued himself by the extramelinary range aum rersatility of his talents. He execlle el in nearly all the then known banches of scione :mel art: lout it waw kowaphy which at a very carly nien seems more than any other scimes to have attracted him. 770

Having completed his studies, he travelled and visited Constantinople, Asia Minor, Egypt, Morneco, Andalusia, and the coasts of France and England. Foger II., king of Sicily, invited him, on his return, to his court, and lavished upon him all the honours which it was in his power to hestow. A favourite wish of this monarch-one of the most refined and liberal-minded men of his age-had long been to have a representation of the carth, founded on the most recent observations. He accordingly invited travellers from all parts of the world to assist him by sending their itineraries, their measurements of longitudes and latitudes, their observations and adventures-in short, all they hal seen or hearil on their journeys. The collection of this material occupied nifteen years, at the end of which it was handel over to Edrisi. Thus guided, he drew up a map, on a globe of pure silver, weighing 450 Foman pounds ( 50.400 drachnas), in which the whole of the then known world was represented. He, like Ptolemy, divided it into seven climates, beginming at the equinactial line, and continuing northwards to the limits of extreme cold, and intersected each of these with eleven 'regions,' represented by perpendicular lines, without any regard to the political or physical features of the respective countries. In explanation of this map, he wrote a book (1153), Nuzhat al-Moshtak, \&e., in which a full account is given of the towns, momatains, rivers, \&e., proceeding from west to east, according to the order of the climates. Careful as he was in observing and collecting, he could not, in the then state of society and communication, but fall occasionally into serious bunders; but on the whole his statements are peculiarly trustworthy; and being the clearest and most reliable exposition of the state of geographical knowledge in those days, the book remained the great and sole anthority down to the time of the Portuguese discoveries. An extract of it was first edited at Rome in 1592, in Arabic, entitled Jrubian Geography, and reprinted in the monastery of Khesruan, in the Lebanon, with Syriac characters, in 1597 -both editions incorrect in the highest degree. The very title was a mistakc, the editors having, by a misinterpretation of a passage, been led to believe that E . was a Nubian. Bernardino Baldi translated this extract into 1 talian in 1000, but his translation was never published. The first published translation was a Latin one, made in Paris (1619) by Gabriel Sionita and Johannes Esronita, a work teeming with the most abswd blunders; and Iomenico Macri translated this Latin translation into Itahan. IRosario Gregorio's Latin version of tho portion referring to Sicily was pullished with the text in a collection of Tardia in 1790. Hartmann wrote an excellent Latin commentary on the portion treating on Africa (Güttingen, 1791 and 1796), and another on the first three chapters of Spain (Marburg, 1802-1803). The entive description of Spain was published with a translation by J. Antonio Condé (Madrid, 1799).

The translation of E.'s whole work, in French, was mate from two MSS. in the Imperial Lilorary, by Jaubert, and puhlished (1'aris. 1530 and 1S40), hut it is unfortmately not sufficiontly faithful. The full text has never bien editel.
W. shall only add that the incilents of E's lifo have given rise to intermiable discussions. The yuar and place of his death, as also his creed, whethre Mohammelan or Christian, still remain roxpl questions. Chief authorities regarding E aro Iladji Kalifalı, Schnurer, De Saç, Slane, Quatremere, licinaud, Amari, ise.

EIDUCATION is an art, the art, namely, of drawing out (hat. cluere) or developing the facml-ties-of training human beings for the functions for
.

## EDUCATION.

which they are destined. Now, in orker to the perfection of an art, it must $\mathbf{l}_{\text {e }}$ formuled on a corresponding science; and of mothing is this more true than of education. lefore we can lonk to momht a human leing in a desired way, the mature of that bring must be well kaown. The knowlelge of man's nature is usually compredembed under three divisions: the constitution of his boly ( $\beta$ hysiology) : the constitution of his mind ( $1 s y \cdot \operatorname{lol} \log y$ ) ; his moral and religions nature (ethics and religion). If we suppose these branches of knowhedge thoroughly investigated, they would furnish the solation of the two main points on whiel all questions of education tum: first-What are the dispositions and acquire munts which it is most desirable to implant and foster? in other words, What is the end or aim that the educator ought to pursue? aud secondWhat are the best means to attain that end? But the sciences above named are themselves in too imperfect and unsettled a state to be the hasis of any thenretical plan that wonk he generally accepten; for our lowowledge of living leings, and still more of moral beings, must, as is now well understood, be the last to acquire the shape and eertainty of scienee. See Scifnce. It is neelless, therefore, to lork as yet for any complete theory or philosophy of eclucation. Education las existed as an art from the very infaney of society, but it is as yet mostly an empirical art, the rules and methods of which have been arriverl at ly the blime groping of experience-by the process of trial and error. The art of education is still in the condition in which the art of agricnlture was matil the present century, when, by the aid of chemistry and regetable lihysiology, then arriving at something like perfection, a scientific foumlation was laid for it by Lichig and others. Even were the sciences of physiology, psyehology, and cthies, on a more satisfactory footing, they would not lee immediately serviceable as a foundation for a theory of education, withont a preliminary step. This wouk consist in deducing from them an intemediate science, embodying the laws of the formation of charucter: Aceording to J. S. Mill, it is a braly of doctrine of this nature, to whieh he proposes to give the name of lethology (Gr. ethos, halut, custom), that woudd froperly be 'the scienee of which education is the art.' But so far is such a science from being yet constructed, that it is only lately that the necessity for it has been pointed out. Notwithstanding this lack of scientific fuundation, the practical art of cducation has, in recent times, undergone grcat improvement in almost all its retails. It is chiefly in discussions on the subject that the want of tixed scientific principles makes itself felt. A debate on any topic connected with edncation nsually presents little but a hopeless chaos of contlicting opinions, the most inconsistent arguments being often urged in favour of the same view. What renders the confusion greater, education is a subject on which every one thinks himself or herself capable of pronouncing an opinion. But this is only another indication of the want of fixed scientific principles. No one presumes to meddle with a question of astronomy or of chemistry unless lie has made it the study of a life. In like manner, it is to be hoped that, in proportion as we alvance to a philosophy of education, there will be fewer who will take upon themselves to settle off-hand the most difficult questions regarding it.

In the present article, we ean do little more than notice the chief clivisions into which the subject of edueation naturally falls, together with the leading questions that give rise to differences of opinion.

Definition.-It is necessary at the outset to limit the application of the term elucation. In the widest
sense of the worrl, a man is culucaterl. either for growl or evil, ly everything that he "xperionces from fis cradle to his grave. lut in the more limited and usual sense, the term education is confined to the eflorts madl, of set purpose, to train men in a particular way - the eflorts of the grown up part of a community to inform the intellect and nould the charader of the young; and more especially to tho labomes of poressimat educators, or schoolmasters. It is evident, however, that school education cannot be anderstomi or practissel rightly excent by those who have mastren the idea of education in its widest sense. it is only the clucator who can appreciate the influences which have rone befure his own, which are rumnins parallel with them, and will come after them, that is in a position to jade of the course to be pensuet.

Moral Truining. The means mapluyed in wheation fall naturally under two heads: disciplines, or moral training ; and instruction, or the imparting of information; although the two often run into each other. Under the heal of discipline, come tho forming of habits of order, self-control, obedience, civility, love of tuth, and reverence for what is grood and great. All but the mere outward forms of tinese is beyond the power of direct teaching ; they are imbibed through the silent influence of example. The chill instinctively respects and revernces what it sues wthers respect and reverence; above all, tho unseltish alfections are called forth only loy tho breath of affection from without. In this part of tho process, it is evident that the school and the professional educator only play a part along with other influences. Nor do they even ${ }^{\text {la }}$ lay the chief part; the home and neightourhood are here the predominant elueaturs.-We cannot here enter into the vexed question of the teaching of religion in schools; it falls under the head of National Education; as does also the qucstion between voluntary and state schools.

As the process of moral devolopment, through the general surroumling influences, is for the most part unconseious on the part both of those who act and those who are aeted mpon, it has not yet secured the attention it deserves; in fact, the other branch of the subject, viz, instruction, or intellectnal education, being more particularly the business of the schoolmaster, has come in common languare to usurp the whole field, so that, by education, wo seldom mean more than the imparting of informa-tion-instruction.

Instruction.-'The lusiness of instruction involves two main considerations-1. What to teach? and 2. How to teach it?

1. Of the vast mass of truths composing the sum of human knowledge, which are to he selected as the encyclopurdpia or curriculum of study for youth? In determining this question, it is to be borne in mind that every truth learned serves two uses -as knowledge to lie acted npon, and as mental discipline. In selecting, then, what to teach, we have to consiler, not only what is in itself most useful, lut alsu what has the greatest degree of improving eflect. On this point, we agree with a recent writer, that 'we may be quite sure that the acquirement of those classes of facts which are most useful for regulating the conduct, involves a mental exercise liest fitted for strengthening the faculties.' If this is true, the promiance given to the teaching of the deal languages of Greece and liome, in modern elucation generally, is more than questionable. It is not disputed that a course of the dassics, well tanght and well learned, is a good intellectual discipline; but so is any kind of knowledge, well taught and well learned, a good intellectual discipine-better than more valuablo

## EDCCATION.

knowledge imperfectly tangt and learnod. The guestion is. whether an equally cool eulture of the faculties would not lie got from a systematic comrse of explal duration of English and other motern lanemares, together with logie and moral amd physical scionce. In this ease, the sulject-matter of the teaning would be an acguisition of great value in after-life to every one, wheh cannot be said of the wther. In the leamed fufcossions, no dombt, and for those following literary pursuits, a knowledere of irreet and latin is of direct use, and will rombtless contime an indispensathe dement of edmeation ; lut frerhaps three-fourths of those who receive what is called a "libemal' chneation, and therefore levoto the strength of six or seven years to fireck and Latim, never olen a book in these languages from the time they leave schonl. We are not prepared to maintain that the sane effects in the way of discipline have as yet been actarlly irolurent, won areat scale at loast, ly the teachiner of science and of modern langrages, as resnlt from the drill of the chassical schonls; but we Jelieve that this arises from the fiact, that no swels course of instruction has hitherte been fursued with the same system amf $\quad$ ersererane which charac. terise classical schools.

In respect of direct utility, the things most nevessary to know, we those that hear most directly-

1. On the preservation of life ame health, and the mopur perfornance of the more common industrial labuurs. This involves a knowledge of our own loolios and of the buties of which the miverse $j$ s mode up ; in uther words, more or less of the kinowledre whidh, when put into systematic forms, is known as the selenees of physiology, natmal 1hlilusnhy, and the other physical sciences.
a. A knowletge of our moral relations. Besides a) knowledre of the orlinary moral duthes. and the hieh religions sanctime with which they are enfarced, this implies some aequantance with the laws of economy:
2. Is a dreliminary step, and as the medimm throneh which all wher linowlwle is eonveyed, there is required a knowledse of the mother-tongue, Ami the faculty of reading and writing it. Allied to language is i knowledre of comonting and measur. ine, and the naming and elassifying of the objects of which the worle is compered (natural history), torether with a knowledge of the countries ant blaces on the earth's surfate (geography).
3. The cultivation of the taste and the imagima. tion, or the facultios which derive pleasure from masic, jaintinu, seulpture, architecture, juetry, and Furks of tiction.

Under the head sicircere will le given a complete tabudar fiew of the varioms hranches of homan knowledge or seiences, together with the corres. fombing arts or applications. It will there he shewn that there is it matural order of depmeteney among the funtamental sciences, whirh determines the urder in which the different kinds of facts sbomld We taken up in latmote. (An ablmirable mappint mit of the whele tieln of knowledire in relation to Wiluation, is given ly lor Neil Arnott in his surevey of $/ 1$ ummen Poomesos. Lond. 1s6i.)

 than a differemen which is raguely and inadefandyy expessed in the nsual division of scloods moto primary sehomle, mindle or lugher sehools, and moneryitios.

1 cmmen of mimary instruction embraces only
 that thar is a limut to the degree of intelligence
that is clesirable in any class of the community; lut for those who most, from early years, spend most of their time in mamual labour, i. e., for the vast majurity of the race, there is a very short limit $t_{1}$, the decree possible. The grame question here wond be to determine the order of desirableness of the different subjects to be tausht, so that, beginning with the most inlispensable, more and more mirgt the added as circumstances would permit. Until recently, reading, writing, and arithmetic were considered the begimming and end of a conrse of primary instruction. These, however, are not so much knowleuge themselves as instrmments for aeruiring knowledge ; and therefore the primary teacher in the present day ennsiders it his duty to give, in addition, as much information of a directly useful linul is possible. But in avoiding one error, he not unfrequently falls into the opposite; for, after all, the three branches alrove mamed are the first and most indispensable steps in instruction. Those who can real and write may acquire information after leasing school. Reading aud writing, unless learned at school, are, as a rule, never learned; and thus the grand access to knowlodge remains for ever shat. Nur is it enourh to have made a begining in the arts of reading, writing, and counting; miless snch a degree of facility is acgured before leaving schoul as to remder the exercise a pleasure, it is not kept up in after-life, and the litlle that was learned is soon forgotten. We beliese that in all schools, but especially where the ehildren are liable to be early withdrawn, everything else onght to be held secondary until the painful stage in learning to read, write, axd coment is fairly got over. With regard to the positive knowledge hitherto got in primary schools, there is a general fecling that few teachers succeed in giving it a direct bearing on the actual concems of life. Hence the aversion expressed in many 'puarters to the introluction of the 'ologies' into common schools, and the rather vague demand for the teaching of 'common things.'

Widdle or secondary schnols either serve for those who have leisure for a liohter degree of culture than the elementary conrse above deseribed, or they serve as nurseries for the lighest kind of educational institutions, viz, the imiversities. Under the luad of secoudary schools may be ranged the justitutions that ro by the names of high schools, acalemies, grammar-schouls (the gymnastums of Germany, and the collegs of France). In these, the course of instruction usually embraces other languages besides the motheretongue, and more or less of the rlements of the varions sciences. The titles of a series of text-hooks, such as those composing Chambers's Eflucutional Course, give a notion of the grat varicty of sulbjects that are considered requisite in middle-chass education. Mith yet remains to be done to chalk out a julicions conrse of middle-class instruction-sutfeciently wide to be a fommation for after acyuisitions, and yet not so multifarions and detailed as to be impossible to overtake exempt as illdimsted cram.-Where preparation for the miversity is the object, (ireck avel Latin are the chiof subjects of attention.

2. 'How to teach it.'-It is a great crror to snppose, that because a man knows a thing, he can therefore teach it. Teaching is one of the most difficult arts, and requires matural aptitule and acquired skill. The necessity of special study and practical training or apprenticeship to make a schoohmaster, is a discovery of recent date, and has given rise to teachers' seminaries or Normal Schools (q. r.), where they receive special instruction in the most approved methods of teaching, and practice in their aplication. It is to the greater acquaintance with right methods, on the part of schoohnasters, that we are to look for the solution of one of the greatest difficulties-hww, namely, to overtake all the work that is necessary to le done in the schoolpieriod of life, without keeping the learners too many hours a day at their tasks. As things are nsually managed, very little of the time deroted to lessons is spent in actually learning anything whatever; as any one may satisfy himself by calling to mind how his uwn time was spent while seated on the sehoolbunches. There is here a rich mine waitug to be worked-the gold-fields of futnre generations. It is not to he disputed, that three hours of hearty, spinited excrtion will do more, in the way of learning, than is accomphished in six hours in most schools. The three hours thus set free would be clear gain ; for time spent in tritling or in heartless fagging is utterly lost. The child is all the whide phagued withont leing profited, and would he better employed in beins happy in his own way. This matter of the halliness of the young has unt yet receivel the attention it deserves in schemes of ertucation. As Siduey Smith has well expressed it, if you make them happy now, you make then, hapry twenty years hence, ly the memory of it:' so that while looking after the formation of other valuable habits, the chncator must not orerlook the halsit of happiness.

Increascal "conomy of time in teaching, besides setting free sufficient time for play, would aimit the nore general intronhetion into schenl chacation uf military drill (inclurding gymmastics). This, in ahlition ta its immediate purpose (see Volvereens), would be a most valuable aill in moral elucation, ly promoting habits of prompt obedience, order, anil inliteness On this sulject, see Commumications Hom Jilwin Chathirls, Ewq., rospectiny Mralf-time "one Militury wal Navel Jrill, made to the Eiluation Commission, and printex among partiamentiry papers. 1861.

EDU'R, a Rajput state of Guzerat, is tributary to the Guicowar, being, in common with his immediate dominions, subject to the political superintendence of the presidency of Bombay. With a revenue of nearly $£ 25,000$, it maintains a force of abont 1000 men. Its capital, of the same name, containing abont 10,000 inhabitants, is in lat. $23^{\circ} 50^{\prime} \mathrm{N}$., and long. $73^{\circ} 3^{\prime} \mathrm{E}$.

E'DWARD THE CONFESSOR, king of the Anglo-Saxons, was born at Iship, in Oxfordshire, about the year 1004 . On the death of his father, Ethelred, in 1016, Comute the Dane obtained possession of the throne, and in the following year married Emma, the mother of Edwarl, by whom he had two sons, Harohl and Mardicanute. Until the death of Cannte in 1035, E. lived in Normandy; he then made an ineffectual attempt to establish his autbority in England; but his mother Emma hal now transferred her affections to her younger chillren ; and she exerted all her influence and energy in Cavou of Hardicanute, who, on the death of his brother TTaroh in 1040, became sole ruler of the Anglo.Saxon kingdom. Hardicanute, however, was generous enough to invite his halfbrother to England, whither accordingly E. went, and was honourally received. On the death of Mardicanute in 1042, E. was declared ling. The person chicily instrumental in bringing about this result was Earl Godwin, whose only daughter, Editha, was marrieal to the king in 1044. The laly only became his queen, not the partner of his lued. For this revolting asceticism, the honour (if it be sach) of canomisation, and the title of Confessor, was eonferred on him, abont one hundred years after his death, by Pope Alexander IIT, Scrupulous as E. was in regard to "ne of the passions, he bad no repugnance to gratily another of a far less justifiable kind. Ilis tirst act after his accession, was to deprive his mother of all her treasures-lifting even the cattle and eorn from her fiells, anl, according to some accounts, cndeavouring to comprass lier death. The whole of E.'s reign is simply the record of the growth and struggles of the Nomman or court party with the national or Anglo-saxon party: for an account of which see artiches Gebwis and Haroles. E.'s wars with the Welsh in 1057 and 1063, anl with the Northumlwians in 1065, were short and successful. He died 5 th Jamary 1066, and was succecded hy Harohd, son af Earl Combin, The prosperity which Enerland enjoyed duriur the reign of E . was owing to its not beime exposed to the wasternl calamities of foreigu invasion, while its free intercourse with France, or at least with Normandy, greatly civilised and retined the somewhat Bootian habits and mamers of its inhalitants.
EDW MRD T., king of England, was the eldest som of Itemry IIf. hy his wife likanor, daughter of liarmond, Gount of l'owence, and was born at Westminster, fune 16, 12:3. That union of valour and iutcllicence which characterised him was exhilited at an carly periokl. At the commencement of the strughb letween homry and his barons, Trince L , whe was then gosernor of the dachy of (inimme, vame ower to lingland, and boldly thelared his dissatisfaction with his fathers conduct. Suhs"puntly, he took the ling's side in the war, and hy his viomoms woneralship put an ent to the insurvectum in in fow yars, lat there is no evidnace to show that ha had changed his opinion uf themy's puluy : and it is remarkalle that he himseli, durin: the wheld of his regn, earefully arwided comber into collision with his nobles. Nothing how. - ver, of any consequence was achitevel ; anf in the following year he set out on his retam to bughant. At Mussina, he heard of his father's death, whereunom he proceded to prance, and dit homase to lhilippe 111. for his French pussecssions, arriving in lingland e5th July 1204. He and his quent, Ble:mar, were crowned at Westminster on the 19th of Angust following. 1 lis tirst military expedition, after his aceession to the throne, was diveted aganst the Welsh. After a contest of marly tom years-in the course of which the fammen l'rince Llewellyn was slain at Llanfair, 11th lecember 10SO-Wales was tinarly subeducd and inomporated with England. 11 is next amlition was to possess himschf of Nootlind. The duath, in 1290 , of Dlargaret, gramblanghter of Alexander III., and known as the Mailen of Norway, who was to have heen married to E.'s son, seemel to have frustrated lis design; hut the selfishness of the ten competitors for the Seottish crown who now apparal, induced them to acknowlelge I. as Loul Parmount of scotlant, "anh hoping that he would thereloy secure the Earlish monarch's support. The competitors were ilso foolish enough to make him unpire among them, or perhaps it would be more correct to say, they were not powerful enough to refuse his arbitration. Be that as it may, le decided in favour of John Baliol at Berwick, 17 th November 1292; and Baliol immediately touls the oath if fealty to lim; and on the o6th of Deember did Lomage to the Faglish king for his erown at Neweastle. The patriotism and pride of the Scottish mation took fire at such hmailiation, and in a short time Baliol was hurried ly his subjects into a war with England. In 1296, E. entered Scotlant, devastating it with fire and sword. He penetratiod as far north as Elgin, compelled Baliot to resign the kingdom, and governed the country by means of his own officers. It was during this expedition that he carricd off from the eathedral of Scone the celematen stone on which the kings of Scotlame used to be crowned, and which is now in Westminster Abbey. A second rising took place in Scotland in the following summer. The leader on this necasion was William Wiallace (q. v.), whom tradition represents as the most heroic and unselfish of patriots. He was completely suceessful for a time, chectly it is to he supposed on accoumt of the absence of Edwart. In the spring of 1098, however, that sovereign again made his appearance in Scotland, and gave battle $t_{0}$ Wallace at Falkirk, on the Ead of Tuly. Partly through treachery, and partly, no donbt, through the superior generalship, of E , who is consilered to have been the tirst military commander of his time in Europe, the Scottish forces were entirely defeatel. The next five years were spent by the English king in reducing the comntry to obedience -with very imperfect success, however. In the summer of 1803 , he led a third large army into Scotlam, and once more spreal havoc and ruin to the shores of the Moray Firth. The last castle that held ont against him was Stirling, which did not yield till the Quth of July 1304. E. Wintered at Dunfermine. Some time after this, Wallace either fell into his lamels, or was betrayed, and on the $2 \cdot 2 \mathrm{l}$ August $1: 305$, was hanged, drawn, and quartered as a traitor, at Smithfieh, in Lombon. E. now probally thought that be hal no further danger to dread from scotlamb, but if so, he was quickly undeceivel. Robert Bruce. Earl of Carrick. grantson of the ehief rival of Raliol, sumbenly left the English conrt, where be hat been resiling, in the beginning of 1306, wiufled once more the
bamer of Rentish independence, and on the 27 th Marel of that your was erowneal at Seone. An L'melish army, monor the Fin! of Pembroke, was immediately "hapatedied to scotland : and at the close of the year, tho king hiuself set out to chastise brure. lint worn with the "sturt and strife' of many yeare, the cares of his own kingo lom, and the anxiotios of emoprest, $\mathbb{E}$ only lived to reach huresh-on-Simde, a village beynal Carlishe, where he expherel, 6th duly 1307 , "in sipht of that comntry,' says, Lorel Ilaile.s, "which he hat devoted tu destruction.'
E. jrossessed most of the rumalities that gn tor form a wrat ruler: valone, prulene, incxhantible encryy, and pertinacity are visible in his whole carcer. he was ambitims, it is true, but in his age, ambition was looked man as a virtue rathror than ats at crime; it was the natural iacemprament of kingly courase. Ilis relations tu sochlan! wrete also unfortmate. Few penple of any mulerstandan:however, now doubt that the best thing possible fir that country would hay, been a peacefnl union with England, for at that time there was no hatred or jealonsy lexween the two nations. The reath of the Maden of Norway destroged every chance of such a mion, and the great mistake committed ly E. was his embavomine to bring about hy force what could prove bendicial only when it was the result of woluntary agrement. The effect of his mal endeavour was to plant in the loreasta of tho two mations the germs of a hitherto noknown hantility, which, in subsequent generations, workel incalculable misehief, and the traces of whech have nut wholly disaphared even at the present day. As a civil rulur, E. is eutitled to the highest praise. lnmense progress was made during his reign in the estallishment and imporement of law and order throughout the lame, the reformation of civil ahoses, and the restriction of eeclesiastical jurisuliction and encroachments. He has been called the English Instimian; and both Hale and Blackstone attim, that 'the very scheme and nowlel of the admanstration of common justice between man and man was entircly settled by this king. 1 relamel amb Wales participated in the lanefits of Vuglish law. It was cluring F.'s reign, tho, that the representation of the Commons of England first became regular; but probably the ereatest alvantage olitained by the nation, was the declaration that the right or privilege of lerying taxes resided in the parliament. In general, it may he said that E. ruded in hamony with the illas ami lesires of the loest heads among his nobles amb lomresses; and though tonchy on the question of his prerogative, like every llantagenct, and very cruel in his treatment of the dows, he mast be regariled, on the whole, as one of the most enlightened, liberal, and sagacions monarchs of his age.

EDWARD 1I., son of the preeding, was horn at Caernarvon, in Wales, 20th April l2St, and in 1301 was cratel l'vince of Wales, being the tirst heirapparent of the kinglish throne who bure that title. He accompanied his father on his varions expeditions into scotlaml, and on the death of the latter at Dugh-on-siands, he led the English army as far morth is Cummock, in Ayrshire, after which le returned to his own country. At home. E.'s conduct was contemptible. While still a youth, he hal conceived an extraordinary admiration and foudness fur a witty, dever, but dissolute creature called Fiers Gaveston, the son of a Gascon lowitht. After he became kinr, there was no limit to the honours heaped on the farourite. Whan he went to France, in the hegiming of 13us, to conclude a marriage with lsabella, daughter of lhilippe V., king of Frame, Gayeston wis left guardian of the kingtom. 375

The aobles were indignant, and demanded his hanishment. Twice was foreston forced to leave EnglamI, hat as otten was he recalled by the weal monareh, whose lore for lum was sheer infatuation. At last the nobles rose in arms, besieged lawenn in Scarhormesh 'astle, and having fonced him to strender, hanged him at Wrarwiek, 19th Jume 131Two vears after this, E. invaled scotland at the head of the greatest amy wer collected in Englaniamonating, accorling to some hist, rians, to 1 (m,000 men. At Eannocklurn, on the 24th Jume 13]4, he wasencomented by liuliert limee ( r . v.) and rlefeaterl with immense slaughter. This victory put Soutland and England on ergal terms for all time coming, amd made the motion of a military subjugation of the fumer conntry by the latter le given up. Finally. in 1:319, after inmerous petty sucesses in the part of the seotch, E. concluled is truce with them for two years. Ife now exhibited asom his imbecile dassion for faromites. The persun selected on this becasion was Hugb be Herpencer. Once more the nolbles rebolled, and both Hind le Despencer and his father were banished in July 1221, lout some months after, were reabled loy E, and many of the mobles, amng uthers, the Earl of Lancenter, were lochealed in the following year. Immelately after, E. invarled sootland for the last time, and penetrated as fir as (ulross. in Fife; lut having achieved nn particular success, he conclualed a truce with that mation for thisteen Sears, amb rethomed to Englant. A dispute now arose hetweell lime and Charles $1 V^{\circ}$. of France, brother of his wife lsabella, in regarel to the territomies which he held in that eomitey. Charles seized them, whereupon E. sent oner Jabella to remonstrate and, if jussible, to fftect an amieable armagement between them. lsibella, it wonld apquar, despised her bualamel. and disliked the blespewors. Sleeting at the lrench comet many Eneflish molles who, eutertamines similar feelings. had left their comery to avoid the enmity of the favountes, she was casily induced to make common canse with them against her lusband and the bespenems. At the same time she fomma a chanection of a criminal kimd with libger de Hortinot. one of the most fuweritul of the exiles. This of comse move thoroughly insolved her in the plot against lorlward: and having olotained possession of the young l'rince of Walis, afterwards Eitwand IlI., she embaked fron Dort, in Holland, with a lame lonly of madeoutents, and lamied at orwell in
 banshenl nobles wre som joined lyy all the influcutial persoms in Encland. E. tlent, But was taken prismere : at Neath Abory, in Glamorganshire: the Thesumers, father amd sin, were executed; and the monareh himself, atter luine formally depersed, ath danary lisez, was muriered in lierkeley ('astle. 2oth heptember of the same year. He left two sma amd two imanters.

Haliklon Holl, near Fierwick, 19th July 1390, in which the Soots were completely defeated. Balinl now assumen the anthority of a liur and dial homate to E. for his phosessions, the result of which act was, that he hat to flee the kingdom in a fow monthe, for the thing most intolerable to the Sentish spirit was that any monarch should dare, or finncy he had it right, to smrember the independ cuce of his country. In the conrse of three years, E. thrice invaded Scotland; hut though le frightfully wasterl the combry, and bronght armies with him such as conul not lee successfully opposed, he conld not break the invincible spirit of the people, when, after each invasion hal rollen over them like a flool, rose and rallied with a still more stublurn and impassioned resolution to be free. But the scone of E.'s great exploits was France. Charles IV. having died withent a son, Jhilipe of Valois, the mearest heir by the male line, ascended the throne, maler the title of Plailipre VI. E. clamed the crown in right of his mother Isabella, sister of Chames; but as the law of France expressly excluded femates from enjoying sovereign rights, it is mamifest that E.'s ilam was ntterly gromaless. The English king achmitted that his mother, being a female. conlil not inherit the crown of France, bat aftirmed that he, as loer som, might. But it is char that lee could not recuive from his mother rights to which she herself hal wo clam. Yet never was a bad canse enolled with more splentid trimulds. E. dectared war against lhilippe in 1337 . His first campaign was not very remakiable: hat in 13N6. aceompanied by his fidest son, known as the Black Prince, he again invadel Prance conpluered a great part of Nomandy, marchell to the very gates uf Paris, and on the ebth Augnst 1346, inflicted a tremembus rlefeat on the French at crey (q. ro). Here the Black l'rince, thongh only sixtecu, exhilited the comase and the prowess of a veteran, shaying with lifs own hand the king of Bohemia, who fonght on the side of France. After sonm: further successes, such as the reduction of Calais. a truce was comeladed lntween the two nations for several years. Meanwhile, the scots had sustanose a setere defeat at Neville's Cross, near Uurham, their king (1)avid) being taken pisoner. In 1:nib, the war with France was renewed, and on the 1!ath Semember of that year, the lilack prinee olitained a milliant victory at Poitiers, Kiner Jom of France (Pliliple having biren reasi for some years) falling into his hands. The Sentel momareli wats released for a rausom of thot, (60) in I3:7, and King John in 1360, when a peace was monelnded letween the French and the English, ly which the latter were to retain their conguests. King dohn, howerer, tinding it not comsistent with the homon or desire of his cometry that such a peace shond bre carpied out, magumimonsly returned to aptivity, and died in Bomdon, S th A April 136:. acconnt of the refusal of the Scottish government to fultil the contract into which it had entered with Henry Vill., ly which it was agreer that Nary Queen of Scots should marry Edward. The lattle of I'inkie followed, on the l0th Sejetember 1547, in whicl the Scots were completely heaten; and Seymour, now Duke of Somerset, might have intlicted most serions damage on the whole comntry if his presence haul mot heen required at home. He retmonel to find that his brother, Lord seymour, hau] been caballing against him. Somerset had him arrested, tried, and condemned for treason, and "in the 2oth of March 1549 , he wis beheated on Tower IIill. In the summer of the same year the I'ontector quelled an insurrection of the populace headed by one Kett, a tanner; lut in the conse of a few months, a more dangerous nulversary appeared in the person of Joln Indley, Earl of Warwick, whose party, by dint of insinuations agrainst Somerset, excited the nation argainst him, aud at last compelled the king to sign his deposition. On the lith of October', Somerset was placed in the 'Tower; and on the 1st of December 15.5t, he was tried before the Honse of Lards for treason, condemned, and executed, 2.a of Jannary $\mathbf{1 5 5 2}$. The people regretted, with grood reason. his death, for Dudley was both a worse and a weaker man than himself. Before Somerset's execution, Dudley bad heen created Duke of Northumberland. He was himself (judging from his (lying declaration) a Catholic, but he certainly took no means to re-estahlish the old religion. His great aim was to secure the succession to the throne of Englamel for his family. With this view, he married his son, Lord Giuldforl Dudley, to Lady Jane Grey, ciaghter of the Duchess of Suftilk, to whom, by the will of ITenry VIIL., fell the crown, in defanlt of issue by Elward, Mary, or Elizabeth. Northumberland now worked upon the weak and dying Elward to exclude Mary and Elizabeth, and nominate Lady Jane Grey as his successor. E. at last consented, and a document settling the succession on this lady wis drawn up in June 1552. The king lived only a few wedks after, dying on the bith of Tuly. Subsequent events entirely frustraten Nortleumberland's design. King bi, during his short reign, fonnded a great mumber of grammar-schools, whieh stild exist, and are known as King E'duard's Sikuols.

FDWARDS, Henri Milie. Soe Milnelimwards, Mesta.

DDWHADS, Jonatian, a celebrated American divine and metaphysician, was born at Wimlsor, in the state of Counecticut, 5 th October 1703, entered Yale Collese in $\mathbf{1 7 1 6}$, tuok his legree of B.A. in the following year, and in 1720 was licensed to preach the gospel. Towarls the elose of 1723 , he was :pmonterl tator of Yiale collese, an office which le dilled with distinguished suceess. In 1726 , he acerpted an invitation to become colleague to his maternal srandfather, Mr. Stululari, in a chureh at Sorthampon, and was orlained in Febrnary 1727. There he lalmmed with intense wal for more than twonty-thene yours, at the end of which priont he Was dismissed by his eongregation. The immediate "utur of the rapture botweed him and his hearers, Was his jusisting that mo 'mennverted' persons should bre allowed to arproach the Lomd's Table; font sume vears before, he had alienated the regards of at lare mumber of the indhantial members of

maffecter, and nobly conscientions. During the famous 'Jevival' of $1740-1741$, he was much sought after as a preacher, and is in fact often regarled as the originator of that movement. Certain it is that as early as 1734 , a local manifestation of religious enthusiasm had taken place in Lis own parish, of which he published an account, entitled A Faithiul Narratice of the Surmising Hork of God, in the Conversion of many 11 undred Souls in Vorthampton. The quarrel between E. and his congregation shews, bowever, that the 'revival' had not exercised any very stroug inflnence on the community in general, since only a few years elapsed between the ecstasies of devotion and the circulation of obscenity. Aiter his dismissal in 1750, E. became a missionary among the Indians of Nassachusetts. While residing at Stoekbridge in that state, he composed his famous treatises on the Freedon of the 1 Hill and Original Sin. In 1757, he was chosen president of Princeton College, New Jersey, whither he proceeded in January 1758, but was cut off by small-pox on the $22 d$ of March in the same yen:-E. will always be considered a master in logmatic theology. Calvinism bad probahly never so powerful a defender. According to the late Robert Ilall, "he ranks with the brightest lnminaries of the Chnistian Church, not excluding any conntry or any age since the apostolic.' Ilis great characteristics are depth and comprehensiveness of argument; and were it not that the age for such discussions as E. loved is gone by, few writings wonld be more worthy of patient study than those of this illustrious divine. Besides the works already mentioned, E. wrote a Ireatise concerniny Religious Affections, the Ilistory of Redemption, a Dissertation concerning the End for which Gorl created the Horld, and a Dissertation concerning the True Nature of Christion Jirtue. The last three were posthumorsly published. A complete edition of E.'s works was published by Dr 'Timotly Dwight in ten vols. (1809), and another at Loudon in 1817. A third was published in 1810 , containing an essay loy lTenry Fogers, and a memoir 1,y Sermo E. Dwight.-Jonathan Eowands, D.D. (hom 1745, dial ISO1), the son of the preceding, was a person of similar claracter to his father, and, curionsly enongh, experienced similar vicissitudes of fortnne. Both were tutors in the seminaries in which they were educated; were dismissed on account of their religious opinions; were settled argain in rutired situations; were elected to the presidentslip of a college; and in a short time after they were inaugurated, died at noarly the same age. 'The vounger Edwards was also a writer of sermons and theobgical treatises.

E'DWIN, an Enolish Saxon prince, was the son of Ella, king of Northombria, who died about 589. He succeded to the throne at the age of thiree years, but a neiohbouring potentate, Ethelfrith, invaled and conequered his territorics, whereupon the infant $E$ was carried into Nortll Wales, and was there eqneated. When he crew up to man's "state, l'thelfritly, fearing that his power would not the secure so long as fit lived, forceal him from his asylum, and for many yours he wantered about a dismuser fusitivo licachime Fast Angtia, le claimed the protection of kinur liedwald, which was radily grunted. While residing there, Ethelfrith sent messenneras to Idedwald, requring him to deliver F., into his lamia, aml threatenime war in the event of a refusal. lienwalld promised to aceede to tho rerpuest. A frimelmale known the resolve to the prince, and comasmbled thight; to this l a wonld not ronsent, hat sat down withont the palace, hrooling ower his misforthmes. Ahout this tame, E's life was attempted by an assassin, sent by the king of Wessex. Hu escalual with a slight womm, and in the same night the fllem was delivered of a danglater. The: king thankel his illols for the birth, lant l'aulinus directat his thankfnlness to the Cbristian saviour. The king promisel to accept the new faith, if IIeaven would grant him victury over the king of Wessex. His child ams eleven of his household then receivel the rite of baptism. Raisine an army, he defoted his fue, hat delayed to fultit his promise. l'anlinus, havinus hearit of the apparition which appeared to him while resiling at the comst of Jiedwahk, one day entered the apartment in which E. sat, and placing his ham 1 pon his head, asket him if he sememleeral the sign. The king was visibly affected, and at once assembled his Witenagemôte to deliberate on the matter of the new religion. Coifi, the high priest, spoke first, and intimatel his willimness to descrt the idols, and embrace the Christian faith. A thane next rose and pronounced the beantifnil sjrech which lans been versitied by so many pocts, hat which is most effective in the sinnle scrions Saxon of the chroniclers. Coifi then healent the penple in destroying the idol temple.
E. and the nobility of his kinglom were baptized in the eleventh year of his reig. Thoreatter, he became the most powerful prince in Endand. He subdued a part of Wales, and his power extended northward to the Lothians. In 634 , le fell in battle at Mattiek Chase, in Yorkshire; and in that disastrous fight, one of his chikren, and the greater portion of his army, perished. The history of this prince has been male the snbject of a beautifni poem (Edewin of Deire, 1861) by Aleanaler Nuith.
EECLOO', a town of Belmim, in the province of East Flanders, stands on the high road leetween Ghent and Briges, and is 12 miles north-west from the former. It is clean and well built; and has manufactures of woollens. cottons, hats, tobacco, chocolate, sonl, \&c.; also hrewerics, Histilleries, vinegar-works, salt-refincries, dye-works, oil-mills, and a thriving trade in linen. cattle, and timber, as well as in graim, for which it has a large weelly market. Fop. 9300.
ELLL, a name popularly given to all serpent-shajed or worm-shapel fishes, and sometimes extented to other ammals of simila form, hut otherwise extremely lifferent, as the ecls in paste, in siuerar, de. The fishes to which this mane is mont cimmonly applied are malacopterous fishes destitute of ventral fins, and having the hody covered by a soft thick slimy skin, the scales very minute, and often almost invisible, or entirely wanting. Nost of then were incluthel in the Limman gemis Muerna, and now constitute the family Murctitio. dividel by sone naturalists into the families sym. branchider, Muremider, Anguillder, Comgorider, and
'hhismbite. All these have thes skweton insertitate of rils, and thew tin rays not jointorl; whilst the
 somesh, have rils anconglassing the belly, and the fin rays jointal menched. In all the wels, the gill-milicas are very samall, and are situated far hatk, so that there is a lone prosere fom the: gill-chandmer outwarle; and herem, the gills mot some beominy dry, thase fishers ran romain out of watow for a considmable time withont injury, and seme of them oceasionally leas it of their own seneme. Ther smallurss of the gill-mpening is also ragarded ans pomahly indicative of focldeness of mopiration; and this, as in reptiles, is conmerend
 hive the gill passages so mital muler a enmman intergment, as to pasent axturnally only a smale orific'. Thuy are ahmost destitute of fins. 'Thes species are few, and fonmb only in trenical and sub-
 destidute of tins, on nearly so; they are all dratitute of scales. They are all marine.- The Ampuilliter, on the contrary, are fresh-watiry fishes, althom sume of them oecisionaily winit the sea. They have pretty large pectoral fins, antal amd dursal fins exteming to and encompassing the tip of the tail, and mumeros lompish seales imbedicel in arouns in the skin, so as to resemble latticework. "or these the Congers (f. v.), although marino, are very nealy alliet. The "phiveridir, or Sinakevels (9. w), of the Moditerramean anl other scas ara more widely dificent, and are masily histingushed by the tail ending in a conical tinless print.

Until recently, all the British freh-wator eols were confoundeil together as of one species (Anguilla Felyaris): Mr Yarrell was the first accurately to distinguish them, and to shew that there are at least three, if not four species, dillering emsimeraldy in form, and in anatomical characters, as the muber and form of the verture. se. "Wo of these semu to be very generally diffused, the Kuma-xusen Li. (.A. rentirostris or A. rulderis) and the limond-suspor Fis (A. lutirostris). The difference in the form of tho

11urnk of Lels:

surnt, which these names indicate is wery marked and obsinhe, and the cmeral form of the slargnosed E. is also more slember.-The simis li. (A. medionustris), fump in sume of the English rivers, is intermediate in the form of its snout, and is considered suprine to the other kinds for the table. Its cervical vertebre are lestitute of the spinous processes which are fund in woth the other species. It is compratively small. The sharp-nesed E. seems to attain the gratest size, sumetimes almost
thirty poonds-weight. It misrates on the apmoach of winter to the warmor brackinh water of estuaries. often entering water which is perfectly salt; or if migration is impossible, it luries itself mand. Eels are taken in great manbers during winter by means of ed-spiars, or lorks with several pongs, flomed into the mul. Sometimes they are digered out of the mut of river-banks, where large numbers are fommi congre. grited together. 'The eels Which a lescend to estuaries or to the sea deposit their spawn there, and countless multitukes of jomig eels ascend rivers in spring. The passage of the young eels is called on the Thames the ch-fiere, from a kixon word signifying to Inss or trivel. So strong is the justinet whicli impels them, that they sumount obstacles apparently far nowe than sufficient to arrest thein fromess: they lare been seen to ascend the large posts of llomidates, "those which dic, stiek to the wosts: ntburs, which get a little higher, meet with the same fate, until at last a sullicient layer of them is formen to enable the rest to orercone the cliticulty of the prassine.' Younse eds lave also sometines bern net with in large numbers performine migrations un land among moist wrass, fenerally in tho erening ur during the night: lat the parpose of these marations is not very well mulustond, mo are they knuwn to take pliae with regnlarity'T'hose eds which ramot migrate to the seit, breed in inlanil rivers and lakes.

Eets are very avere to eold, aml to this is ascriled their winter descent $t$ " larackish water, or hiding of thomselves in mad. "llee munber of known species is lurge, hat they all belonif to the temperate ame wamer regions of the glolee. In these also, the marine dishes to whoth the name $L$, is sonetimes axtented, chicily almumal.

These is a projurlier in some enuntrins-partionlarly in Bentlamb-atainst eathus ects. wh arcount of their serpent like aproarance: lat senmally as in limeland, they are hiefly estermed. The Lomilon mathet is very largely supplem whth acls thom Holland: they are sent over alive in welled vessels.
'There ano varions means besides thone alreaty motied emplayed ho the eapture of the ewh. Wints anl stages and erested aeross mivers, anillaskets, or buche, as they are temmed, fixed in them for tha* taking of the eels during their migrations. "These loukets are of larise size, amb shaped like a hame Thanese jar, in the month of which is litted a sont of funnel-sharach monse-trap entrance, compuserl of flexilole withy rows cominis mwarls to a laint, atml throush whinh the eds can easily fore dheir way ; but when they turn alomet to lime the infrinue arain, it is rlosed armanst them. Siniggling is a favourite amusement with

Eth Sniggling Apparatus**
somp anglets. A rod or a long stick is provided, bent round at the slender emd like the top of a very well usen fishing-rad ; on the point is fixed a single ring; through this ring is passed a piece of string; one entl of this is held in the fisherman's hand. "I'o the other end, on some fine but strong eord, is fasteued a stout darming-needle. tied to the cold by the midule. 'l'he wedle is then baited, or thrust leagthwise into a large lolrworm, until the tine eorid alone comes out of the head of the worm. The wom is then drawn w, to the ring of the rod. The fisheman then secks for some hole in which he thinks an cel may le, and applying the point of the rol, bushes the worm into it. is soon as the fisherman believes an eel has swallowed the bait, he gives a slight pull to the string: and the meedle, which has crone down the celds throat inside the worm jerfectly straight, leing tied lyy the midale, turns erosswise in the eles throat or stomach, and hooks him. Clod-fishing is thus practised: a 'fuantity of lab-worms are strung by means of a needle on to some stout worsted mutil a considerablu bunch of them is ohtained: this is tien to the end of a cord, which is again tied to a stout pole. When the eds are on the nuve. the fisherman takes his station with a pal half-full of water within reacla; he then drogs his clow into the water, and allows it to sink to the bottom. As sonn as he feels an eel tugrimg at it. he stealily and quiekly, hat without ferk, raises the bait from the water. 'I"he ed frepuently has its tereth so entangleal in the worsterl as tol me malile to lot go, and thas is lifted from the water. The hast is held over the pail, it shake or two disloglese the end, and the elod is then -Troperal into the water agnim, to fish for mon'e. fometimes two or even thre vels conme no at ance, and a meat monber are witon taken thas.

EGER, a town and river of Austrin, in the province of the Emeryo, we must refer for an exhibition of of Bohemin.-1. The town E.stands on a rock on the right bank of the strean of the same name, is 90 mides west of Pragic, and near the Bohemian froutier. Formerly, it was a border fortress of some importance ; its walls, however, have heen almost cutirely pulled down, and its fosses filled up with rubbish. Among the conspicnous edifices of E. are its churches, of which there are seven-one of them, the deanery church, very handsome; the marketplace, within which is the large town-hall; two monasteries, a Domimican and a Franciscan ; and the barracks. East of the market-place is the house of the burgomaster in which Wallenstein was assassinated in 1631. The mins of the imperial burg or citadel, formerly the residence of kimgs and emperors, is situated in an angle of the fortifications above the riser. From the milst of these ruins rises a singula square hack tower, constrncted of masses of Volcanic tufa. The Domble Chapel, consisting of two stories, the upper supported by graceful marble pillars, is a tine specinen of Gothic architcoture. An arenne, nearly three miles long, leads from E. to Franzenbrum (q. v.). $E$. has manufactures of brubzeloth, kerseymeres, cottens, chintz, leather, suap, de. Pop. about 10,000 . ..... 'The river E. rises twelve miles north-west of the town of E., Hows first south-cast to E., then adsances in a general north-eastern divection, pass. ing Ellogen, Saaz, Birdin, and Theresienstadt, near which town it joins the EIbe, after a comarse, inchading wintings, of alment 120 wiles. Its current is raphe, its banks high, its bed stony, and no part of its course is narigable.

EGE RIA was the name of the Nymph or Camena from whom, acoorling to the legend, King Nima received the ritual of pablic worship which he cstablished in Fiome. The grove where Numa met the godless to receive her instructions was dedicated hy him to the Camenre. Homan legends speak of tiro groves dedicated to E.-one near Aricia, the other before the Porta Capena at liome, where the grotto of E . is still shewn.

EGGi, or EIGG, an island 12 miles off the west const of Inverness-shire, and 8 miles south-west of the sonth point of Sliye. It is $4 \frac{1}{2}$ miles long by $2:$ broad. It consists chiefly of trap, which in the nurth alternates with sandstone and limestone, the latter rocks eontaining oolitic fussils, carbonised wood, and coral. The houir of Eigen in the sonthwest, rises 1339 feet. The upper 470 feet of this hill is a mass or vein uf pitehstone, 1! mile lonit, and 100 foet liroad. Some of the pitchstone forms straight, inclined, or curver columns, from a fow inches to nearly two fect in diampter. la oue place, the pitelistone overlies red simistons, conglamerata, trip, and the silicified woorl of an oolitio phe. In the soutl part of the isle is a large cave, entered by a uarrow opening, through which only one person can crep at a time. Ilere it is tralitionally related that the Lairn of Maclome, to revenge an injiry elone to some uf his clan, smoker to death all the inlabitants (2)(0) Nacionalds) of the ishe, whol liad hid themselves iu thic cave.

EAC (omm). In a meat majonity of the liflerent kimds of ammals, reprombution takes place by means on wiers: in other words. ther anmals are oriparous. It is only in the Wemmulin that we find animals traly vivipurous; whilst the marsupial quadrupeds abul the momotremate furm connectine links, in this pert, of thar natural history, leetween tho mammaliat Whelh are vivipamon in the follest semse of the Lom, aml the wamm-homled ammals (biods) whiels atw avipirous.

the differences between oviparous and viviparous reproduction, and of that original and essential acreement in important purticulars, which has heen strondy asserted in the saying, Omne animal est oro (Every animal is produced from an egg). To the article Develorment of the Embrio also reference must be made for what may be called the history of the egs, and the development and uses of its several parts.

The number of eggs varics extremely in different animals, some birds producing only one at a time, or in a year, others twenty or nearly so, whilst the roe of the herring, salmon, and many other fishes, contains myriads of egge. 'The eggs of some amimals are enveloped in a gelatinous mass; those of some are joined together, and are laid in a kind of string; those of others are connected together in varions ways. For notice of sneh peculiarities, we mnst refer to the articles on different classes of animals.

The coonomical uses of egrs are well known. The egos chietly used are those of hirds, although the egrs of turtles are also in grat repute as an article of food aud laxiay, anl those of fresh-water tortoises are valued for the oil which they yield. The birds' egrss chiefly used for food are those of the species commonly domesticated as poultry, and others allied to them-gallinaceous birds and web-footed birds. Of gallinaceous birds, the common domestic fowl, the timkey, the pealien, and the guinca-fowl, produce the eggs most gencrally used and brought to market in different parts of the word; of webfonted birds, the common duck is in this respect the most important, although the eges of other inatide are alsu used for food, and those of some of the other web-footed marime-birds are nuch songht after by the inhabitants of the wila and rocky shores which they frequent. Thus, the cggs of gulls and guillemots atford an important article of food to the people of St Kilda, and of some of the Orkney and Shetland Islands, as well as to the inhabitants of Iceland and other far northern regions. It is in quest of egrgs, as well as of young birds, that the dangers of the most tremendous precipices are braved by men whom their companions let down by ropes, and who gather the eggs from the rock ledges. The coasts of Labrador are also visited by eggers, who collect the egos of sea-birtis, and carry them for salo to some of the American ports. The eggs of some of the sea-birds of the West Indics are of considerable commercial importance. See EgG-mrro.

EGG, Cimemistry of. An ordinary good-sized hen's eger weighs abont 1000 grains, of which the white coustitutes i 100 grains, the yolk 300 , and the shell 100. The wlite or glaire of the egge is a strong solution of Allmmen (q. v.) in water, and whilst readily miscible with water in its omlinary state, it becomes insoluble when suliceted to lieat, as in boiling an erg. In 100 parts, the white or glaire of egs consists off-water, 80 ; dry allumen, $15 \frac{1}{2}$; salts, de., $4 \frac{1}{3}$. The yolk or yelk of the lurie is eomposed of a strong solatmon of illmmon, throush which montitndes of minute whonles of oil are suspemded, which render it essentially an emalsion. In 100 prarts, it consista of-water, 6aid ; rly albumen, $17 \pm$; oil (with small proportion of salts 3 , $2 \mathrm{sin}_{3}$.

## Jide, Mundraf, for Mendine EgG.

EGG: TlZADU, English poultry does not supply egers in sullicient fumatity to meet the home-demand, on acconal pardly of the large consumption in manufactmes. 'The indicioncy' is male up' by importations, chiedly from Franee. 'There are no moans of asecrtaining the number of egos protuced by Euglish poudtry in the conrse of a year ; but the importations
are recoricel in barlimentary paners. "these importations have largely increased withen the lat few years. In 1sid, they ammontol to alont of millions: in 1860, to noarly lathillinns. lequs were, until recently, "stimated for ristom house purposers by the conbic foot; and in 15:54, mut of 740,1606 enhio
 rest principally frome belgime 'Ilace compuled real

 The inported exgs are sudum equal in quality to those homerprolucet; they are oftor groliad in damp straw, the odon from which pemetrates 11 ." shell, and imparts an mpleasant liavom th the egg. There is a certain warmth in mw-latil or grock eggs, which tombs to formont tla damp straw, or other substance in which they are packen, and this fermentation re-acts unom the curgs in the way stated. Until the recent romoval of the dhety, imported egegs paid $4 / \mathrm{l}$, $\mathrm{p}^{\text {nor }}$ cubic font if from Britisit possessions, aad Sle. if from forcign comotrics.

L'GGA, a large town of Westem Africa, Yaruba conntry, is situated on the right hank of the Nieer, in lat. $5^{\circ} 43^{\prime} \mathrm{N}$., loug, $6^{\circ}$. $0^{\prime} \mathrm{E}$. It is said to be two miles long. Its strects are narruw; the housus are privecpally luts built of clay, the walls smonth, ams stamel with iudigo, (rreat quantities of narrow cotton cloth, only a few inches in breadth, ame genemally dyed blue, are manufactured here. The inhalnitants are conterprising and commereial, many of them possess eanoes, in which they trade np, aml down the Niger. These canoes are coverol ly a sort of shed, under whieh the tramers sleep at night. The chicf articles of trade are beatifully earvel calabashes, eloth net-work, com, yams, swect potatoes, dried tisl, and a few European articles, as beads ancl gnnpowder. The popmlation, which is said to be immense, is partly Mohammedan amb jartly pagaz.
EGGAR MOTH, the name of certain specius of moth, of the genus Lasiorampa, allied to the silk-wom moths. One species (L, trifolii), of a uniform foxy

Therar Muth and Catcryillar (Lusiocemper mifuhi).
ochreons colour, with wings expaniling ahout two incles, proluees a 'atorpillar as thick as a swan's 4uill, hairy, and ochrems lwown, which feeds sumetimes on broum, but frequently iu elover-fields.

EGG-BIRD (Ithtrocheliton fuliginosum or Stona filiginosa), a live of the cull fimily, sometimes callell the sooty Tern. It is fuliy larger than the common tern of the British shores; has a loas, slember, nearly straight, compressech, sharp hill: very lona narrow, aud pointed wings, and a long deeply forked
tail: the generat colome is russy black on the riper parte, "xespt the forchend and the rolges of thes wings, which, with that moker part, are white it almumber in the Whet Jumion seas, ant is to bue sem

 harren ishets whepe it beals. When risitors land on these kerss the disturned bieds rise and tly alout in clonuls which darken the air, whilst their turmal werpowers even the rar if the beakers. The nest of the E . is morely a little excavation in the same, and nsually contains three nergs, which are fully two inches lone of a palocream colom, spandy marken with light-brown and purple tints. The eges are estemed helicions, and form an object of protitalus adenture in the monthe of Marela, April, and May to the erews uf mumerons small vessils, fitted out from Kincston, Havannah, and other West Indian ports. Curims enstoms preval amons the egsgatherers at the must frequented kers, and common consent has established a kind of mode of laws moner them. The eggs remain fresh and fit for use anly for a short time. Alone with the exge of the E , those of the Nomdy are also gathom, and threse of the Sandwich Tern and other allien species; and
 extembed in the West mities to several of the terns.

EGG-PLANT (Solunum melongrnet), an ammal

Esc-plant (Solunum) :
A. purihe variety; 13, white variets.
usually less than two feet ligh, with stem partially womly; frut very much resembling an egey in
apearance, and varying in size from that of a hen'serg to that of a swan's ecres in colmur generally white yellow, or vinkt. The ruit is much used as font, not only in the East Indies of which the plant is a native, lint in warm combtries generally, into which it has been introduced, its cultivation extoming to eomparatively northern regions which have a waru thong not long summer. In linitaia, the E . is scarcely to be seen except in hothouses. The fruit is known ly various names-as Eirgaphe, Anbrjine, Drinjal, \&c. It is als, sometimes calleat Mad Aphle and rews Aplle, names prodably transfirreal to it from the poisonons Ande of Sodon (Sohemm Sodomenm).

FGilAM, a villace in the north-west of surres, (11) the left bank of the Thames, is miles west if dombin. In the ricinity is limnymede, a meaden ond the Thames, where King John conferred witls his lames before signing the Magna charta in 1015 Noar alse is Comurs Hill, rendered famons by Jenhan and Pone.

E'GNLLALD. or JEINIARI, the boomather of Gharlmanke, was hum towards the emb of the reign of f'pin, or the besiming of that of charlemane At an carly ace lie repared to the come of the latter monareh, and herame a philit of Alcuin. His talents and acruirements ganned him the fasour of the emperom, who appointer him his private secetary, and superintment of public luidinus. E. acempmied the emperor in all his marches amb jonmess, never seprating from hinn except on whe oceasion, when he was lespatehed ly Charlenagne wha a mission to Poje Leob. On the death of the cmpror, he was apminten preceptore to Lathaire, sunt of Lonis le Dehmmaire, and for a muntore of vears aftowards apmars to have lem lay abont of sarimes momasteries; lint ultimately lecominc tired of secular life, he retired the the sechuded town of Mhhlheim. Here $h_{2}$, rected a momastery, amb chamed the mame of the flare from Mithlhem the Crelimenstadt (City of the filesoml). He nuw agreed witi his wife to comsiler hom unly as a sister, mut Focame a monk. E. died 20th July 84, and was tomed beside his wife, who diow in son. The two cotlins are mow shewn in the chapel of the castle at Erbach. The counts of Erbach trace their haseent from Egimard. Ilis l'ike Comoli Inemi, completed alout the year soo, with respect to pian and execntion, as well as languase and style, is ineontestahly the most impertant histurical work of a lioneraphical character that lias enme down to nis from the midille asos. It was frepuently used as a selinellurs. and was therefore copied ad infintum. The best cerman edition is that of Perta in the Monmmente ricrumbier Misforica. Ilis Epistuler: (iz in monler, are alse of comsilorable value in a historicat puint of viow. The fremeh consider the edition of E.'s works ly M. Tenlet, wath a translation, and life of Lis ( 1544 ), to be the lest and most complete. 1F's secoml work, the Ammins Rirymm Frentomm, Pipmiar C'aroli Mermi, Illulumici Improtatoris, muliraces the perionl from 741 to S29. Accoringe to apretty legemb, lin's wife, Emma, was a damgiter of charlomigne. ## bglinton, Earl of. Sce Montgomerie.

E'GMONT, beviles indicating several other phaces of inferior interest, desionates the prin. cipal hathome of the Falkland Islands, and also an netive volcano in New Kealand.-I. Port E. is formed on the north coast of the more westerly of the principal two islands of the sroup, its seawaral harriers being the islets of Feppel and Saunders. It is in lat. $51^{\circ} 21^{\prime} \mathrm{So}$.. and long. $60^{\circ} \mathrm{W}$. The anchorace is anot; and the shores afford fresh water, lint are almost lestitnte of word.-.2. Nount Lis is m the northerly island of its own gronp, risings 8840 feet abowe the sea. It is 18 miles to the sonth of New Jlymouth, in lat. $39^{\circ} 15^{\prime} \mathrm{S}$., and long It 13' E .
mgMONT, Lamothl. Count, Phinee of Givpe, was lom in the castle of La Hamaite, in Ilamanlt, in In2.2 and inherited his property and titles from his ehler luother "harles. He accompanied Charles Y . wh his "xpedition against Algiers in 1541 , and followed that monareh afterwards in all his cambaigns. lut withont distingushing himself greatly: After the acerssion of I'lilis, to the throne, E . commanded, with great suceoss, the eavalry, in the battle of st guention, 155\%, and mext year in that of cravelines: and when Philip finally returned to Sinan, le left dis Kremor of Flanderis ind Artris. In this position. E. enteral into alliance with the party in the Netherlands that were dissatisfiel with the Catholic policy of Philip, and from a courtier lecame all at once a man of the pepple. This promi, imperious character, howerer, and his suliseifunt conduct, have imluced many to smpuse that, likw his hosom-frient the lrince of Grange, he was less actuated in this loy bieh motives than by sulf-interest, or at least liy disalnanted ambition. The more common opiniou, bowever, is, that he was a humane and virtnons patriot, wh, altwors imliferent to Protestantism ats a religion, was anxims to do justice to all the members of that ofpessen faith. When Margaret, IMChess of Trama, against the will of the Protestant party, was mate regent-meral of the Netherlands, E. and the Trimen of Orange entered the eouncil if state, and held the command of the few Spanish troups. At tirst he sided with the party who were disomented with the infringement of the liberties of the provinces, and the introdnction of the inquisition; lut when insurpections broke ont, he at last broke with the l'rine of (1range and the ' Begrars' Leasue, as it was called. Tre secmed to havo rostomed urker, and to be maintaining it, when, in Apmal Jom, the buke of Alla was sent as liente-nant-reneral to the Netherlands. The l'rinee of Grane and other chiefs of the insurection left the country: E, wishing to save his private proproty, remained, thinking his return to the court ham" scoured his safety. When Ahai chtered Bras-
 to secure lis farsur by presents. The appeared to hawe gainad his contidence, when suddenly, after a sitting of the cmanil, he and comat Hoorn were tronchemsly enjand, and carried to the eitand of Ghont. "Mhe states of Brabant songht to whthlraw lic from the bomby tribmal, as it was

## EGYPT.

and the temperature varies from $84^{\circ} \mathrm{F}$. to $32^{\circ}$, The most reaarkahle fhenmanon is, Lowever, the regular merease of the Nile, fal ly the fall of the tropical rains, which commence in $1^{\circ} 1^{\circ}$ N. lat., in the spring : and falling first into the White, and then Bhe Nile, reach leyp in the midille, and the lelta in the encl of Jume. In the middle of July, the red water appears, and the rise may le dated from that time; it attains its maximum at the end of September, and berins to decline visilly in the midile of Getorver, and sulsides to its minamm in April. At the end of Nowemler, the irrimated lanl has dried, and is sown, and is covered with green crons. which last till the end of Fhmary. In Darch is the larvest. The state of the Nile, in faet, marks the season more accuately than the variation of temperature. E. is ly no meaus remarkalily healthy, as, in ardition to the visitations of pasue aud cholera, ophthalmia, tiorrhea, dysentery, and hoils often $l^{\text {revail, and Eurnpean, anl even Nigritic }}$ races cannot le acclimatisect.

Giculogy.-E. is separated from Nulfa ly a low hilly region abont tifty miles hean froun north to sonth, eomposel of iranitie rucks. The same erystalline rocks extemilup the share of the liwd Sea to nuar the openine of the Gulf of Suez, stretchine inland for fally thirty wiles. The setacry in this district is will and rude. and the course of the Nale is frequently internupted loy eliflis and lrolsen masses of granite, fomming masuiticent cataracts. The granitic requon terninates at Assoman. the anciunt syene. From the roeks hore wereobtained the materials for the enlossal and mone. lithie monnments of Egypt. The valley of Crper Egyt is bountel by two ranges of hills ruming northwarl-the Arahian range on the right, the Libyan on the left of the river, both alike eomposed of cretaceons strata. the prenmmant rock being sandstone. This is a durable aul uasily worked stome, aurl was cunseruently extensively used in the erection of aneient temples. The city of Thebes was built of it. The cretaceons sambinne extemds from the cranitic roclis forming the first cataract at Assuman fur abont 85 miles to Esne. where it is eavered by a limestone belonging to the ujper ehalk series. This contimus on both siles of the valley for almot I 30 miles, when it is covered hy a tertiary nummulite limestone, which forms the further prolongation northward of luth rancis uf hills. Becanse of the easy disinterration of these beds, the secnery in the limestone districts is tame and mano. tonous : frequent table-lands oceur, on one of which are built the thre pryamids of fizeh, the material curdoyed being the prelominant limestone.

Over a large extent of E, these rocks are eurerel with movinf desert sads, and in the dat lands burdering the Nile, with the allnvinm lronedt duwn by its waters, aul which hats formel the leelta at its menth. This alhaviun emsists of an argilaceons eartly ur ban, more or less nixet with sand and a quartzuse sand, puobely derived frum the andyent deserts lyy biolent winils. It is remarkable that this sedinemtary demesit has motraees of stratification, and afso that within short distances, great varieties are mowned in what aro apparently synchronnos dennsits. Ar LIarner's recent "xamination of the Nolu "lopsits, and the striking conclusions he
 ald. attention L., lue paid to these d"pusits lately. Sue Wharmis.

Velural Histary amb Proutuctions. The fertilu valley of the Nife :unt the duesert resions which nachise it, ar very difforent, nont only in their hutans, ]at in thair zowlegy. Ore of the most
 mas, which furmerly rewhed the belta, but is now
to be seen only in the more sonthern parts of the Nile. The ginafe is nccasiomally found within the soutliem borders of Eerypt. Thi jackal and hyzena are common; also the ichuenmon (q. v.), so mach webrated amonig the ancients: and the jerboa. The me-humped camel was riminally introtheed by the Ptolemies for the transit of the Iurlian trate. The other usual domestic quadrupels have existed from the most ancient times. Of dowestie lirels, waterfowl were anciently the most numerous; the gallinaceons poultry mow eommon not being probably of oller late than the Persian invasion. Pigeons have always been aboudant. The Egryitian multure (q.v.) is a conmon and notable bird, as is also the ilis (1). ..), held sacred hy the ancient Egyptians, and of which may fables liave been related. The ostrich sometimes occurs in the desert. Of reptiles, the most famous is the cromalile of the Nile: momers (1. . . ) are also abumiant, saurian rejutiles of considerable size. Smaller lizarls abound. The trionyx, ir soft tortaise, is plentiful in the Nile. Sulcents are ummerous: muonsst the most venomons and ireated of which are the asp (q. v.) or haje, and the cerastes (q. v.). E. abounds in tish, the wost remarkahle being the Minny (see Barbel), the Latus (oue of the nerels fanily), the Bayad or siturus, the (thromis Silotict, and the Mormeres oxyrhymetur. The sacred beetle (Scarubens sucer) is one of the most remarkahle insects. Loonsts are a Ireaded pest. E. is still notalle also for the abundance of the other creatures mentioned by Muses as its plagues.-Many of the European trees and plants are found in E.; the date-falm, the doompalm, the sycamore, acacias, tamarisks, \&c, are among its more peculiar lootanical productions ; also the papyous (p-apu), which aneiently supplied material for pager, and the lotus (shain) or water-lily of the Nile. The extensive eulture of Mayrus has loen, in molem times, replaeed by that of the sugarcane, cottun, indige, and tobaceo: and the plant has almost disatpeared. Gourds and melons have always alownded. To the wheat and harley of antifuity have loen adhed maize and durra. E. is very deticiont in timber trees: the Iharaohs obitained celar from Lebanon and ebony from Ethingia. The rocks of E. afforded the stones userl in its edifices and sculptures; granite, syenite, Jensalt (at Assuman), hreceriz (in the Cosseir Roul), morpyry (from the quarries of Gebel Doshan, openci in the reign of the Emperor Clandius), sandstone, and lonestone. Namaster (furmd at Tel-elamarna) has heou nsel from the earliest perinds to the present day. Emeralls are produced lyy the mines of Celocl Zalara: salt, matron, and-since 1-50-sulphur, are anong the wther mineral prorlactions of Exypt.

Dimisums.-The comentry was anebently divided intu 44 nomes 2 in $^{\dagger}$ [per, and as many in Lower lisypt. Eich nume or adproment hal a separato lanal municipal gevermmont of a nomarela of liele. trmant-numernor, hat hesiless enverners of the cities, of the temples, seribes, juldes, and wher frnctionaries. Thedre limits were measured and Alemed by lamplarks. This division, as ohl as the 4 the elyasty, varion in munder adiderent tines. Under Sethos 1. IIr sissotris. there were of nomes-10 in the

been divided inte Masrel-lahri or the belta; thw Faioum, El lhostani, or Midele Eyypt ; and Es Said or Upper bisypt.

The most remarkahle antipuitise of the comentry will be foumd described under the: manes of the places where they ofeur: see Abotsmubth, Alexivihan, Edfur, Membis, Therss, de. while the mare remarkable objects of antipuity will lw given moler

The poputation of the comitry mast have lown large at the carlicst perimb, as 100,010 men were employed in the comstraction of the dreat l'y ramid alone during the 4 th dynasty. It has leen plabed at $7,000,000$ under the ['harahs, listrithoted in 1 sim) towns, which had increased to 2010 under Amans, 505 e.c., and mparls of 8000 maler the F'tolemics. In the reign of Nero, it ammanted to $7,500,0100$, without the natives of Alexmmia, which at the time of Diolorus contaned : $: 10,000$ inhabitants. By the census of 1559, the proulation was $5,125,1005$, although ly that of 1544 it was as hav as 2,500,000. The great bulk of the inhabitants con sists of native Mohammedans: the Copts (If. ©.) are estimated at $150,0(0)$, and the rest is compused of Bedurin Arabs, Neprues, Abyssinians, Juks, Syrians, Greeks, Armenians, Jews, and Western Europans. The original monlation appears, buth from the langage and the physical conformation of the munmies, to have been of Astatic origin. afterwards blended with Ethopian by subsequent irruptions and eonquests; but there appears tha have been an aboriginal race at an early perini. of copper colour, fair propertioned, althongh with rather thin legs, large feet, rather high cheekbones, and large lips. Aecording to fleroctutas, Diodorus, and Plato, the system of castes prevailed in Egypt. The first of these aathors says there were seven castes-of priests, warriors, cowherds, swineherds, innkeepers, interpreters, and piluts. Diodorns makes only five-priests, soldiers, cultirators, shepherds, and artisans; and Plato the same. The evidence of the mumments, however, shews that these were rather comditions of society than castes, as the different orlers not only intermarned, but even, as im the case of priests and soldiers, held both employments. As in all bureaucracies, the sons often obtained the same employments as their fathers.

Relifion.-The Egyptian religion was a philosophical pantheism, the various attributes of the Deity being divided amengst the different gods of the Panthoon. Unlike the Greek, where a god was honoured in a separate temple, each Egyptian divinity was ac companied by a put or 'company', of companion-gods. The principal momes ant cities had each a family grour of gods, con sisting of a parent deity, a wife and sister, and a son. Thus l'tall or Vilean, the epronymous and principal god of Menphis, formed a circle with the gudesses I'asht and Bast; and his son Nefer Tun, Amen Ra at Thebes, was allied with Mu, Nit, and Khonsu. These tetrads, or rather triad: for the female principle was dualised, were often accomponicil by iufcrior deities; and persmaifications of the elements, passions, and senses, and feclings were introduced. The worship of some triails, however, became universal-that of Osiris, 1sis, and Horus being found all over Egypt at the earliest
perion. Thbe gels, imatud. are stated by the (irecks to have bew thand inter the are more orilars.

Thoth.
dear, ane lefemed by Thoth, the Egyptian Logos, at the 'great julducnt' before his teasers. Set and the comsiratura, was the type of the judgment and future destiny of man, and all deceased were called ley his mane. See (osiris. Numerous inferior deities, such as $\mathrm{Il}: \mathrm{L}$, , the Nile, appear either as uther forms of the sinuses deities on heal varieties of the myths. Each ileity hat its sacred animal, while received a local whenhip, and which was considered to be the 'sicomel life" of the deity it remesenter. The special animal selected was installed in the andean of the temple, and gave macula resumes. The most remarkable of these animals was the Apis boll of Memphis, whose worship had an national extension. The Egyptians lelneverl in the transmigration of sones, anil all not sutliciontly pure to be almitton into the courts of the soma, in whose bookies had perished before the expiration of Bon years, passed from body to body (see Embanima), having first deseemblel to the "11ados, and passed throng h the apmintel trials and regions, enterrimini to reach the manifestation to light. In this progress, the sind was required tor kan and tell the names of the doors, regions, and their grampian demons through which it hand to pass.
(Wromology and History. One: of the mont imppurtant paint of Efytion history is the who uncial, imwluine as it ans the date of the earliest historical forth of man. In the time of Itoldony
 nytuc, ligh-priest of Heliopolis, drew up, at the request of the king, a history, in which he divided the spare of time from lanes to the mempuest
 work of Alamethe has perished, lint chomelegioal - fiches remain in the isorks if Julius Africans,

 Surgical information, and the lemon of kimono

 the diserepany of then ciphers, and du inacempary

very different results; lint in England the chronology of Usher, which, from the Itelrew, Idacel tout be. as the date of creation, and 2348 c. 6 . for the Deluge, has somelnw obtained the sanction of theological writers. To recompile these conflicting authorities, two schools of chronological critics, called of the Long and short Chronology, have arisen, and the epoch of Menes has been placed lo the allocates of the long chronology, as boüch, at 5702 enc., by limen, at 3043 enc., by Lensing, at $3892 \mathrm{~b} . \mathrm{c}$., by 11 entry, at 5815 bic. ; while the same date falls, according to Sharpe, 2000 Bee., to Nolan, 2673 be., and Poole, 2717 B. C. Unfortunately, the monumental information is defective at certain periods, while in all, the national custom of dating in kings' reigns only, without the use of the controlling date of any cycle, renters the subject still more obscure; for the Suthic cycle, or Costar prim of 1461 vague years, was met in official use. The celebrated hieratic paris at Turin, of the age of the 19th dynasty, which contained a system of chronology arranged on a principle of cyclic and regnal guars, has unfortunately suffered so much mutilation that it is imposesidle turanstract it satisfactorily. It is therefore better to armure the history according to the dynastic successions of Manctho, giving these as waves of time, leaving the question of their duration to induingdual judgment. It present, the elaborate systems of chronology are only chronological draughts from recollection of a vast ruin, each more or less haply w defective in some 1 articular respects or general conception. There are not sufficient monumental data for a sure conclusion about the remoter dynes. ties. My thically, Egypt was sail to have been first groveled lis a dynasty of gods, who, according to Manetho and uther Greek authors, were Yulan or fatah, It clios the Sun or Ra, Sos or Slut, Saturn or Sols, Osiris or Ileshar, Typhon or Sati, and Horns or 11 or. These gods reigned 13,900 years, and were succeeded by the Manes and demigods, whose reign occupied tow more years. Bat considerable differqucerxists in the lists-that of The les giving Amen, Mentu, Tum, Lu amd Self, Osiris, Sett, and Horus; that of Memphis, Ptah, Ha, Shun, Sob, Osiris, Set, and Horus. After the reigns of the goals, the epoch of Menes is the first 1 Want in the chronology of the history of ancient Egypt, and has been placed, as a hose mentioned, by the rival systems of elironchlogy.

No contemporary monuments of Menes exist, but he is said by tradition to have corrupted the simplicity of the $l^{\text {matriarchal life of the nation, mastituted }}$ the first laws, and divine worship, founded the temple of lead ley truing the course of the Nile, by burns of a barrage, to the west at Kosheishe, and to have foumdeal Mennefer or Memphis, after some expeditions against the Libyans, aud to have men devoured by a croculide. The statue of Menes is represented horne in ancestral procession in the reigns of lameses 11 . and 111 . at 'Th elves, hat no contemporary moment of this monarch waists. Rameses II.
married a princess of this nation. It is the tablet of this monareh which is found at the Nabr-elKell, or Passes of the Lyeus, near Beyront. This monareh subjected Ethiopia. which had revolted, to his arms, reimposed the tribute, and placed the country again under the government of the prinees of Ethiopia, or Egyptian vieeroys. He also established a fleet on the Nediterrancan. His name and reputation formed the hasis of the legendary Sesostris: the exploits if the monarchs of the 18 th lynasty, and probally of his successors, being united with his fame. The reign of Rameses, although it exhbits a deeline of art, yet demonstrates $E$. to have been in the leight of ita glory; and his epoeh appears to have been abont 132.2 E . C., a special calendar having been senlptured to recorl the comeitence of the heliacal rising of the Dogstar aud lst Thoth, or commencement of the fixed and canicular year. His place of burial is meer-tain-perhaps in the vanlts of the Ramessenm. His thirteenth son, Morienptah or Menephthes, succedded him upon the throne. transferred the enpital to Nemphis, successfully contended with the Tamahu or Libyans aml the liabu, and appears to Le the Amenophis of Manctho, and the Pharaoh of the Exolus. Fle introduced the heretical worship of siut, seth, or Ty]hon, and was suceeeded by Rethos II., Amenmes, Sipthah, Tausri, and Setimekht, whane marlorions reigus close the 19th dynasty. 'Thee crmmection of Rameses III, with the previous dymasty is ohseure. This monareh was chiedy at war with the Philistines, and the other maritime tribes of Greece and Asia Minor, amb gained nuval viduries in thas Menlitermanem, and repeated tho comquest of lathiopia. 1 was follownd by the splombial bat inglurions linw of the kimessids, the sixth of whom gainol viatoriws in Vthiopia; and the twelfth of whom, havimor maried a princess of the land of liakhtem. sont the ark of the god Khums tu lakitem, at the request of the momarel of that wountry for the rum of the gneen's sister. The fall of this dynasty allumas to have been owing to intarnal revolution, as their fanite successurs helat the office of hinh priests of Amen lia at 'Ihelres. 'lhey held the rownoment for 130 years, and entertamen! foreing relations, one of the monarelns having marrial a princess of the kutennu. 'Ihes and dynasty, the manmmental, is rather confusel. Thiy were alsu ligh priests of Amen Ra. Shathank l. im the liblical Shohak. Ilis invasion

A glazel pottery or 1 mecelain (see Potrwis), the potter's whec, and the kiln, arpear in the 4 th; and the art of metallurgy, with the use of tin, at the same perind. In the military art, the Ergitians used at an early age defensive armour of shields, curasses of quilted leather, and helmets; while spears, clubs, naces, swords, daggers, hows, and hatchets formed their offensive weapons. For sieges, they employed the testudo, ladders, toreles and lanterns, and

A Gimard apparently with a Lantern.
mines. The army was composel of infantry till the he cinming of the 1 Sth dynasty, when war-chariots were introbiced; for, prior to that periol, the ass only was linowu and uscd for transport; and carriages not having been invented, persons and goods were transportel, in the panniers of asses, or on a Lime of sadde slung between two of these usefnl anmals. War-boats mo dombt existed at an early meriod, and are mentioned as early as the 12th dynasty; but sea-going vessels unt till the 19th, nim no flect till the lith. The Nile, howerer, was constantly navigated ly row-galleys with sails. An extensive commerce was carried on with acighboming nations, and their tribute enrichod the comintry with slaves, cattle, gems, raluahe metals, and oljects of curisity. lare animals were collected for ostentation. Under the earlicr dynasties, the chicf occupation of the nation appears to have been rearing cattle, cultiwatiug !rain, inlulging in hanguets, fishing, fowling, ade tho chase, an Ithe establishment of each uoble contained in itsclf all the oryanisation and artificers necessary for its maintenance. How transactions were carried on without the use of money, is not very clear, unless gold circulated mouldel in the flaphe of rings adjustenl to a given weight, lut coin plate is mentimed ly its promeds, muce and its chncers. hut. Thu l'ersians tirst intronuced money. See Nominmores. The wealth of famdies was, howerrer, filent on the tombls and furniture rif the deal, and the preparations for cmbalmins, which were on so vaist a seale that dilial priety dind mat disisuin in motyage not only the spoulchres, but the rory mommes of its ancestors. Sue Embarmas. Amasments wore varioms, from the singhesticls an 1 jurgling, the dance of almebs, the hall-fight, to drandits, dice, and merris. In fred anmint Jeypt ham a material vivilisation. Which rexerted all the reguirements of imdustry, and formet mone of illenoss. I'keasure was the object of exiotrou, not, however, natemperal by the raice of wasm we the apmala of romseime, the morat code of dutheshemfispure as that of contemporary nations.

Tle civil government was administered by the three upper castes. The priests, distinguished by their superior knowledge, cleanliuess, and godliness, hal the ecelesiastical; the temples being auministered by bigh ${ }^{\text {rriests }}$ and an inferior hierarchy, with oversecrs, anil governors of revenues, domains, and donatives. Each temple, like a monastic institution, had its earefully subdivided organisation, each denizen having a separate charge or jurisdiction. The political and civil government was arministered ly royal scribes, or secretaries of state, who attended to the revenue, justice, foreign affairs, and all the interests of the excentive. Sacred scribes attended to the ecclesiastic interests, and inferior scribes to the local interests. The public works, the collection of grain, and of the linen dues; the cattle, workmen, wells, irrigation, had each their scparate superintendents and scribes. The military force of 410,000 men, at a later period, comprising all arms of the service, was ruled with severe discipline, and under the direction of nomarchs ( $h a$ ), colonels (hrai), captains (mer), and lieutenants (atnu). The criminal aud civil law was adminis tered by judges (satem en ash), who held travelling assizes, and to whose tribunals the necessary officers were attached. The athlophoros or stan-dard-bearer also transmitted the decres of the royal chancery. The execution of deeds required so many witnesses that frand evidently often occurred. The superior position of women in the social scale, notwithstanding the permission to marry within degrees of consinguinity usually forbilden, shews that the Egytians reached a bigher point of delicacy and retinement than either their western or eastern contemporaries. Colossal in its art, profoud in its $1^{\text {millosophy }}$ and religinn, and in $\mathrm{l}^{\text {ossession }}$ of tho knowletge of the arts and sciences, E. exhibits the astonishing phenomenon of an unexpectedly high and ancient civilisation. See Bunsen, Afgyptens-stelle, 5 vols. EIKON BASELIRE，a work presumed to have been written by dharles 1．during his combinmont． lout now mone correctly imputed to another writer． The following are the explanations ui M．Chizat on the sulject，in his Mhatory af chime Crommell and the Enylish Commomerath．－It is to the LiRons Imsilike that tharles 1 ．is mineipaly imbleted for the mane of the limal Martyr．The work is not les lime：external testimeny and int mad evileme buth pombine to rinowe all dimit on the matter，fr Gammen，Pishny，tirst of Exntor and aforwards of Worcester，untur the ruign of barles 11 ．，was its real autlow：Int the mamascript had fenhably been prosed and armoned，perlaps ewn enrected，by Thandes himself durine lik residene in the lele it Windt．In any case．it was the real expression and true fortrature of his poition，characto r ，and mind． as they han beou formel by misfortume；it is romarkahle for an deration of thonght whic is at once matural and strained；a constant mingling of
blind royal pride and sincere Christian humility; heart-impulses struggling against halsits of obstimate self-conscimsness; true piety in the midst of mis. muiled conlact; invineible, thongh somewhat inert Jevotion to his faith, his homour, and his rank; amd as all these sentiments are exjressul in monntonons language, which, thongh often emphatic, is ahays grave, tranquil, and even unctunus, with seremity and sarluess, it is not surprising that such a work should have profoumily affected all royalist hearts, and easi]y jersuakei them that it was the ling limaself who adiressed them.'- Vul. i. 1. 31.

E1'LENBERG, a town of Prussian Saxony, is situated on an island of the river Nulke, 26 miles east-morth-east of Merseburg. It is reached ly two bringes, is surrowded by walls and diteles, aml consists of the town proper with four submors. The manufactures of E. consist of calico, woollen yarn, tobaceo, starch, rinegar, and brandy. Pop. about 99140 .

EILETHY'IA, a city of Egypt, anciently Nuben, and known at 1 resent by the name of El Fab. The town was anciently walle. The present ruins comsist of the remains of small temples delicated by Tameses Il. to 1 a ; a Ptolcmaic tomple dedicated to the Eponymous goddess by flayscon or Energetes Il., with additions by P'olemy Alexanler T., and Uleopatra; and another temple derticaten ly Amenophis 11I. to the local deities. The names of vther monarchs are also fonnd in the rums; lont the most interesting and impurant remains are the rock-tombs excavated in the ricinity. That of Aabmes-Pensuben, a functionary, records his military services in the wars of the early monarehs of the 18 th dynasty argainst the Shos or Shepherds, and other Asiatic ani Nigritic races. Anotlur, of Pahri, is decorated with paint. ings representing the pursuits of anviculture. Swino were sacred to the local goddess. The town itself, during the lsth dynasty, appears to have been governed by juinces, and some of the tombs appear as late as the 19 th and 2 oth dynasties.-Wilkmson, Modern Eyypt, vol. ii. 1. V70; Champullion, Notice Descrintive, 13.265 ; Lrugsch, Reiseberichte aus Aegypten, p. 214.

EI'MBECK, or EI'NBECK, an oll town of Hanover, is situater on the Ilme, forty miles sonth-south-east from Minover, in lat. $51^{\circ} 49^{\prime} \mathrm{N}$., long. $9^{\circ} 50^{\prime}$ E. It was a place of consideralle importance in the 15 th c., but has decayed sreatly in lesent times. It is surrounded by olit ruinons walls, which are entered by five gates; its houses are antiguaterl ; its strects narrow, turtuons, and bally pracel. One portion of the town, however, which was burned duwn in 1506 , has been rebuilt in a greatly improved manner. E. has manufac. tures of woollens, cuttoms, and linens, and chemical promuets; amt has distilleries, hreweries, tanneries, and tolacco-facturios. l . own its origin to the pildrimares matle to the Thapl of the Holy Llood, fomoded hede in 1094 by Comet Alexander von Waral. I'ap. Soloo.

ElMEOO, me of the Siciety Tslands, in tho Pawife (heoan, lies in lat. $15^{\circ} 30^{\circ} \mathrm{s}$, amd long. $150^{\circ}$ 10 W., abont :"llalles to the west-nnrth-west of 'Folniti, the prineipal momber" of the eromp. It masanres nime miles ly lime and mmbers alont lom inhabitants. It consists of deef valleys and alimpt hills the formor well coltivated, and the lattor has aily timbured. It is worthy of notiee chin Hy as the "ralle of l'olynuman Christianity. Hhere, in or atont $1 s 14$, occhred the first propular manifestation in favome of the new relinion: and hore was costablishcel, as an instrument of
evancelisation, the South Sea College of the London Missionary Society.

EINSIEDELN, a small town of Switzerland, in the canton of Schwyte, and 9 miles north-northeast of the town of that name. It is wortliy of anention on account of its Fenedictine Abbey, contaming a latack imare of the Virgin, to which about 150,000 pitrims annally repair. The town has 55 inns and 20 alchouses, sulpurted chiefly by the pilgrins. The delication festival of the abbey, lyth Septomber, is the great lilgrimage season. The present abbey, one of the tinest in Switzerland, was linilt at the beginning of the 18 th c ., anol is the fifth since the foundation of the abbey, in the loth century. Its treasing was rifled by the French in 179s. Pop. about 8000.

EIRE, EYRE, Jestions IN (cormption of Lat. in atinere). By this term, both in England and Scotland, were the jndges of Assize (q. v.) formerly desiguated. Justices in eqe were first established in Englaud liy the statute of Northampiton ( 1176 A.D.), in the reign of Henry II. At first, they made the circuit of the kingdom once in seven years; bnt by Magna Cliarta, c. 19, the chief-justices are directed to sumd justices through every connty once in the year. In Siotland, the chief-justiciar, says Erskime, i. 3. s. 25 , was originally bound to hold yearly two justice courts or aires at Edinlourgh and Peebles. This comt sramally became fixed at Edinhurgh. Besiles this court, suecial justice-aires, were frequently bed in the more remote parts of the country by the king in lerson, or by judges named by him, twice in the year, in spring and antumn (st. Robert IIf. c. 30,140 c. 5,1491 c. 29). These courts were discontinned, but revived by 1557, e. Sl. The term is still in uso in Scotland, where, at the commencement of every eircuit, proclamation is made to tho lieges to attend the 'circuit cire.'

E1sENACH, a town of Germany, Saxe-Weimar, is beautifully situated amid finely wooded bills on the 1 Törsel, 45 miles west from Weimar. It is a prosperous and industrious town, is surrounded with walls, which are pierced by five gates, and is well built, with wide, clean, and well-paved streets. E. has a ducal palace, a large and bandsome bailding, now used as a court-honse; a spacious marketplace, including a handsume civie school; numerous churches: and a school of design. Its mannfactures are woollen, cotton, amd linen goods, soap, whitelead, meerschaum pije-bowls, leather, and carpets; there are also brewuries and tanncries, and oil, powder, and spimning-mills. Pop. 10,000 .

On a lufty eminence in the immediate ricinity, somomurded by forests, stands the castle of Wartburg, now used as a prison, but formerly a residence of the lambistives of Thuringia, am worthy of notico as tho spot where the Mlinnesingers ( 1. v.) assemblet to $l_{\text {rall }} a$ trial of skill in $120 \%$, but chiefly as being the asylum to which luther, at a time of great langer, was carried ly his friend the Llector of Saxomy, who. waylatist the ereat reformer, seized him, with a aphowane of vomencc, and lumried lim to this fastuess, where he remaned in safety from Nay lowl to Narch low. The elapel in which Lather prowhol, :s well as the chanber which he indalnitml, ame in which he diseomaterl the livil One by throwing the inkstand at his head, is still pronted oul. Another portion of the castlo contains a fint arnonry, with suits of the 1 Gthanil 17th, and evon, it is sain, of the l3th and 14th centuris's.
 town of (acmathy, in the duchy of saxe-Altenburg, is situated wn an 'minnonce now the Sarle, 26 miles cast of Wemuar. it is well huilt, its chief edifices
being the eastle, the olservatory, the lycenm, and the town-house, H. has mamfintures of woollons. porcelain, and corthenware, and has live annomal fairs. ['op) bollo.
 north of the province of Notria, 2f mihos west-rumth.
 porsessimg, and it is worthy of mention only for its commection with the braborge (ore monotain), at the sumthern base of which the lown lios. 'Ihis monntain, which is alout ash feet hith, amb ibeont five miles in eircumference at the hase, is laterally a solid mass of iron ore, of a yuality so fich, that, instearl of cuttiner mines into it and followiner the metal in veins-which proeess was formerly alopted here-tho top and stides of the rock are quarited from the outsich, and the wre is then brokern small, and conveyed to the smelting-lumse without furthor peparation. Mines have hesel worked on this monation for upwaris of 1000 years. Arrarmito (Eismblate, or Flos firri), resombling bramehiner coral in form, and of the most leration and lumest white, is fomm in grottos in the interior of the mountain. Nowhere else deres it wecur in urual perfection. E. has l's smelting-louses, 3 furnioes belonging to govermment, and a I"unlation of aboll, amployed in mining.

EISENSTATVT, a free town of Past Hungrary, stands in lat. $t^{\circ} 500^{\prime}$ N, and longe $16^{3} 30^{\prime} \mathrm{F}, 12$ miles north-north-west of Oedenburs. It is in walled town, has two gates, and consists principally of three main streets. It has also a limaneiscan monastery, containing the lomial vanlt uf the Esterhazy fanily, who are the proprictors of the palace, which forms the chief arehitectural feature of Eisenstalt. This palace was built in 1653 , but was altered and enlarged in 1505 . It contains 200 chamburs for guests, and lias a saloon sutiticiently librge to lino 1000 people. It: library contains a hitguifieent collection of church-musie-masses, litanies, oratorios, \&e., with some of 1 lanlel's ASS. In the suburhs is a conservatory, one of the largent in Furope, containing 70,000 specimeus of exotic plants. I'op. 5700.

EL'SLELEF, a town of Prussian Saxony, is situaterl alont 25 miles north-west from Morse. burg, in lit, $51^{\circ} 33^{\prime}$ N.. lones $11^{\circ} 33^{\prime} \mathrm{L}$. It consists of the Old Tosm-which is surmomided by walls and ditches, and has suven gates-the New' ${ }^{1}$ 'own, anel the submobs. Li. Las manufactures uf potiosh and tolaceo; in the vicinity are copler and silver mines, mul smelting-works. Pol, 10,285. I lere, wn the 10th Noviuber 1483, Luther was horn, ind here also he died, 16th Fubmary 1546. The hususe in which he was borm wats partially consumed by fire in I689. An interesting remoant of it. lows. ever, is still extant, having the portrait of Luther luaced over the entrance. $1 n$ the church of st Andrews are the cap, cloak, and uther relies of the great reformer.

EISTEDDFODS, the mane given to the satherings of Welsh bards for conpetition in mational minstrelsy. See Bard, and Welsif Language ani Literature.

EJECTMENT, ACTIOS OF (Ejectio firmer), in English Inw, "is a possessory action, wherein the title to lands and tenements may he trimb, and the possession recobered, in all cases whare the party clanning title has a right of entry.Selwyn's Nisi Prus. "Thee action of ejectniont." says Lord Mansfichl, is the creature of Westminster Hall, introluced within time of memary, and monded radually into a course of ymatic, by rules of the courts. - Fairclaim of Foucler '. Shomtitle. 3 Lurr. 1ヵy2. According to the strict

## ELAPS-ELATER.

ELAPS. a remns of wenomons serpents, imhabiting the warm parts of the world, and chietly the Inlian islampls, Jew Hollamd, and tropical America. They are of slember and eylinelrical form. with an elonated head, and utten of liright and leautifnl erloms. They are wot revy asile, are said to prey chiolly on ather reptiles, aniblive mons the luxwriant vergetation of meadows or of forcests.

ELASTIC TISSOT, known also as Jellow Filuruns 'Tissue, is wue of the forms of Filmus Tissue ( $\mathrm{q}, \mathrm{v}$ ). It lerives its name from the remankable physical propraty which it possesses nf fuer mittimg its fibres to bo dawa out to domlle their leneth, wal again returnins to their originall lenintle. It occurs in varimes ligamestons aml other structures of the animal looly in which elasticity is recured, is, for example, in the vocal chorls, the momirames connection the cartilaginons rings of the tawhen, the midde eoat of the arteries, the stin, 䟚.

ELASTICITY, mPPRINCr. MHen an extermal force acts unum a solial homy, it produces at tiost slinht alterations in the relative positions of the particles: and if bofore these alterations excued a certain limit, the force cuass to mot, the praticles return to their fommer positiom, and the dishomement disanduars. This power or moperty of recovering thei previons form after alteration, is called dasticity, and we are justified in ascribing it to all londies, thoush in very diferent degrees. It was once believed that there were defmite limits within which chances of form prodnced by pressure or uther forees disappeared completely. It was thomat, for instance, that when a weircht of no great magritude is suspended from a metallie wore, the slight increase of lemeth which the wire is noserved to mulergo. is complately lost when the weight is removel: and the limit to which the wire might thus be stretcheql, and still sutfor nu permanent merease of lenoth, was called the limit of its clasticity. But recont more acourate experiments have shewn that no sum limita "xist. at least in the case of mutals: ons which is the sime thiner, that permanent lometleming results, howerer slinhtly the wire le luadel-it nerer contracts again quite so far as it was strenthol. It is mensiary, therefore, tu fix the limit arbitrarily: and this is lome hy arreming that it shall ho hejel to beerin when the inctal in
 of its lem_th. To sot the clastie extensilility of a wion, then, we most compare its length with in wiplat surpurmed, with it. length when the weight is renmond. In this vay it is fumal that the extrasions produen are jroprential to the watembiner forces or wairlats. From this law, thon, whern "alconlate what weight it womld rapure to struth a wire or mod of a square inch in section to donble its own lenorth; sulpusing it possible to procem so far withont lacelingit, iend that dhe law of casticity continmes mpto this Imint maltored. This weright. which is differ-at forever netal or kiml of wond, is callenl the wenflicion or monblas of clestleit? if
 in eulualating how far at uxam weinht will asteml at
 mut vanclant for the sambe mutal; for all viscumstammos that imwente the elensity of the metal,
 Mastivity mot only whon "xtembed in lometh, hat alan whou mongersenl, wher lunt, or when twisterl.

 rum ht atce tha melmmen!, it, is sin to have tomeherd the mamble, mut in at pmint, hat in a rirele of surveral
 at lime its sphrumal hape wer that extent. In the Y H2
swme way the mark of a well hit colf-ball is pretty broully shewn mon the face of a chab after the strute. The elasticity shewn by wires and tlureads of glass when twisted, has been turned to aconunt in the Torsion-lalance ( $q . v$. ), for measurimg other weak forces. Sted, ivory, canotchme, dee, are well known for thei elastic moperties, to which they owe nuch of their ntility.

The proprogation of waves of somat thromern solid budies depeods upm their masticity; and from (1)servations of this kind made with different suhstances, the modnlus of elasticity for each may be deduced; the results, however, liffer slightly from those arrized at by attaching weirhts, owing to the hat prodnced by the vibratory movemnent.

All sudid bobles are only imperfectly clastic-that is, they din nut guite recover their form and volume when the disturling force ceases. Liguids and gases, on the contrary are perfectly elastic, or return exactly to their uriginal link or volume when the prossure is removed. The elasticity of licuids anel :rises, bowever, acts only in expanding after compussinu, while that of solibls acts also in contractims aftor extensim. I'he expansive elasticity of liquids and erases is equal to the force used to compress them. Water ant uther liquids are easily seen to be compressible, by the fret of their conreying sounda somul-wave icing merely a state of compression, [mopargated from each layer of the liquid to the wext. The coefficient of clasticity of water deterwined hy Colladom ans! Sturm, from the velocity of somod in the Lake of Geneva, agrees very well with that determined by direct measmrements in Oerstert's apmatus. The liscovery of the comprossihility of watev is an English one, due to Canton, in 1762. Prerions attempts, by Italian and Iutela philosophers, to compress water by hammerime is silver shell filled with that ilhich, had failed to gire any eertain result, as the water was forced throngla the pores of the metal. At is tumperatare of 50 , ame atmosplere comploses whter to alont $0 \cdot 99990.5$ of its rolmme. From the existance of a maximum density temperatme for water, sonne comions consephences atrise with regard to the effects of Iressure on the tluis. The rolumes or bulks which a friven plantity of agy gas assumes maler dilfurent. pressures, are vearly in inverse proprotion to the Messmes, See Manfotras L.aw. The elasticity of ases is usually annasured by the heirht of the column of meremy that they sustain. The elasticity of anses is a furce man and varionsly emplayed

## ELDER-ELDON.

The wood of the E is yellow : that of old trees is very hard and tongh, takes a fine polish, is used hy turiers, and as a substitute for box-wood in making mathematical instruments and other articles. Tops of tishing-rorls are sometimes made of it. The pith of the young shoots being very light, is gencrally used to malke pith-balls for clectrical experiments. Tors for clilaren are also made of it; and few boys are unacipuanted with the use of E. Iranches, frum which it has been expelled, for makine p"p snons. The E. is very useful as a screen-funce near the sea and in other exposed situations, as it grows with remarkalle vigour, and makes great shomts, the testruction of the more tunder and less matured parts of which in winter only temis to make it more hushy and useful for shelter. It is readily promagatell by portions of its shouts stuch inte, the groumi.-The Scarlet-freted E. 1.5 meemnag). a mative of the south of Emrope and of Siberia, mach resembles the common E ., but has sufter and more berbaceous shoots, remarkably large buhs, which are conspicuous in winter, and racemes of greenish-white flowers, which are followed ly scarlet berries, the racemes of ripe fruit having much the arpearance of beautiful pieces of coral. It is a frequent ornament of shrubluries in britain, and when in full fruit, is almost urivalled in heaty, but more frequently produces its fruit in cold districts than in those where the milder winter induces it to flower lefore the spring-frosts are over. The juice of its berries is a powerful suluritic. -The Dwarf E., or Dinewort (S. Elmhus), is a ratler rare livitish plant, a coarse herbacous plant. with fetid smell. The inutr burk has been emplogel in dropsical complaints as a hydragogue cathartic, and is given in the form of a lecuction prepred by boibing drown 1 uz. of the bark in $\simeq$ pints of water fill the whole is concontrated to 1 pint. The dose is ahout 4 fluid ounces. In smaller quantities, it is useful as an aperient in certain chronic disorders. The tomers are white when freshly flucked, lont hecome yellow in druins. and consist of a molatile oil, certain gummy, resimons, allmminous, and saline matters, and are stimmant and sudnific. They are emplased in the freparation of chler flower water by ading 2 gallons of water and 3 oinces of rectifice spirit to 10 pounts of the flowers, and distilling off ahout 1 gallon. It is a good perfume. Whit? alder ointuant is promed hy boiling equal weights of lard and elder howers, and pressing through a cloth. It las an agrecable oulour, and jo "mployed as a cooling applation to surfaces which are imitake. When the lemeries are expressed, they yidl! a purple juico mamed diler rob, which, whes dilutel with water, is useful in inflammatory and fetrile complaints as a conling drink. It contains malic and citric acins, susar, gum, \&c.
fation, Baros, Jard ITigh Chanceltur of England. John Sontt, hetter known as Larel Ghdon, was horn 4 th June 1751, in Love Lane Neweastle, of ohseure lint respectalle parents. William Scott, his father, began life as an apmentice to a' fitter, a sort of water-carrier and hrolier in conl: later in life, he beame a 'fitter' himself, and hept a pullic-honse ncar the guay, to sumply drink to his keclumen on the track-principle; he 'ngacel also in succulations in shiping and marine insmranee. By his various socupations he hecame walthy, anil diel worth alont E2Q,04n. John siont's mother was a langhter of a Mr Atkinson of Kewastle, and to her, Lord Cample.ll, in his life of Lond bldom, traeces the talem inheritul ly hor sons Wrillian ant John
 for many yours of the High court of Ammalty. Sc* Sownta, liners.

John Scott was educatel muder the liev. Hugh 2loises, at the grammar-school, Neweastle, and as a boy gave no promise of his snbsequent spleadid career. On fimishing his education under Mr Moises, he, on the 15th May 1766, entered Umiversity College. with a view to the church; the following year he oltained a followship, and in the summer of 1771 won the prize for the English essay, but did not otherwise distinguish limself. A clandestine marriare, into which he entered with a Miss Surtees in 175, nearly ruinet him; however, by the advice of his brother, he returned with his wife to the university. Here, dmring the year of grace, he lived on his fellowship and gains as a private tutor ; and the year expiring without a chureh liviug falling racant, he betork himself to the study of law. In 1770. le was called to the bar. Ey this time, his wife's friends had becume reconciled to her, and made her some provision; and by the death of his father, in the year of his passing at the lor, E. found himself in possession of 玉3010. On his own and wife's money, he foumd he could just manage to live, and so setiled on the northern circuit. His success on his first circuit was not great; but in his seeond year his prospects, through the aid of his brother and friends, hegan to lrighten. It was not, however, till 1780 that prosperity could be said to have cla wned upon hin. A hapy chance then occurred of shening both his talents and powers of work. The result was spredy affluence. Busimess poured in upon him; and by 1787 his practice at the equity bar had so increased, that he was forced to give up the castern half of his circuit.

With suceess in his profession, E.'s ambition expanded, ant he becane political. A silk-gown, and then, throngh the favour of Lord Thurlow, a seat in parliament, were lut steps towards knighthoud and the post of Solieitor-general conferred on him by Pitt. From this point, his progress was secure, and bffectel much in the way in which political lawyers usually succeed. In 1793, he lecame Attorncy-gencral. In 1799, the office of Chicf justice of the Court of Common Pleas falling vicuant, his claini to it was not overlooked; and after 17 years' serrice in the House of Commons, le entered the Jonse of Feers as Baron Eldon. In 150], on the formation of the Adlington ministry, E. ascended the wimpack-a post given to him nominally because of his great anti-Catholic zeal, fut really lecanse of his part in the intrigue which oustel his oll patron 1'itt from office. From this time till 1827 , with little iutermission, E. coutinued to oreaje the worlsack vader suceessive gosernments. He was in succession Chancellor under Adington, Pitt, and Lord Liverpool; and when, after the two lrief administrations of Canning and Golsereb, the Inke of Wellington constructed a calrinct. B . asain expected the woolsack, and resenter his nom-apmintment to it. Ilis love of wfice imburl contimum to the last, and in 1535 , we tind him actually in homs of oflice monder l'eel. In lorit. he crasel to speats in parliament. In 1801, E . was made an earl he (ieorge 15 ; and in the same year, his brother William mas raised to the perase muler the tithe of Lord stowell. In 1531, he lost by death his wife, his 'beloved Bessy.' His brothor Wrillian dion in 1536 . ITe himself, attor motheing almost all his immediate relations, djed in his 5ith year, Jamary 3 , 1838 , leaving beland him a fortube of over hasfi a million sterling.
$B$ is salil tu have lewn a man of very winning and courtly mancres, and of a lianisome, prepossessing apparance. In the cincle of his friends be is saif to have hom inrosistible, and probably tw the "hams of his manner his suceress in life was somewhat owing. Ins carer amply pows that he was

PA, Fifolis, in the diomman mate, ware those grat guino who lank the right of deatimg the
emperar or ling. In the earlinst times, under the Carloviusians, the erown was lereditary; aftorwards, "armany lieame furmally an elective monarely. lut the election was practicaly ahmost limited to the reigning family. U'nder the Emperor Chames $1 V^{\text {., the right of election became limited to }}$ the hullers of the lighest ecclesiastical and civil offees, smme of which sradually liecane hereditary, and comected with territorial pincipalities, as in the case of the Johenstanfens and of the Dukes of Bavaria, Saxony. Swalia, \&c. Thas there arose seven Clectors, those wi layence, Treves, and Cologne (as being the chiuf primates and chancellors of the empire), the electors of the Falatinate and of Bivaria long exercising the right loy turns, and the electars of Brandenturg, SAxony, aud Bohemia. From 1400 to 1708 , the right was never exereised on the gart of Bohemia. lat otherwise no chance took phace from the midulle of the lithe. to the preace of Westphalia. Ly the peace of Westphalia, an eighth electorate was estallished. Bavaria and the Palatimate being each allowed the full right; and in lobs, a ninth was added, that of Bruns-wick-Lunchug, hot not withont resistance by the electors and states of the empire, so that the new electorate was not fully recognised till 1710. In ]7\%. the mamlier was again rednced to eight, the Elector I alatioe inhuritiny Pararia. The electors hehe a ligh and very puenlian position in the German empire. The (ividen Bull describes them as 'the seven pillars and lamps of the holy cmpire,' They hal ecrtain important rights and privileges. They were leagned from the year li3s for the maintenance of their freerlom of election against the prope. They had royal dignities, only not the title of Majesty. The termionies belonging to their electorates were indivisille.

The prace of Lnneville, in 1801, male a great change in the German empire, and subsequent changes took place during the times of French aseendency, which issucd in the dissolntion of the ancient (rerman empire. The title of Elector, still nsed ly the Flector of ITesse-Cassel, an elcetorate which was allaed along with other new electoxates in lvir. is the sule relie of the old dimities, mal is now merely numinal.

Elempolidi ('monta, or, more properly, ('is, was a searlet eap, turned up with amine, which was wanta ly the electors of the Empire.

Electoral Crown. lt was chsed with a dami- circle uf culd, coverul with pearls, amd on the top was in flatiee with a crose on it, also of gehl.

negative pole, which they partly rench. num partly are bumen by the axyen of the air on the way. The same takes place, though to a much less extent, whe the nergative jule: so that while the positive bale hecomes hollwed out or blnat hy its losses, the megative peld remnins pointed ly its apparent rains. The wastin: away, particularly of the positive pole, in a short time renders the distance between the poles tor consideralide to allow of the passage of the enment, and the light is thus suldenly extirguished, until again renewed by contact and removal. The tronsterence of matter lretween the pules is considered to acconnt for the existence of the arch of flame, and the passage through the air of the current, as thereby a conduting medinm extends letween the moles. The hent of this arch of thame, or moltaic arc, as it is called, is the most intense that can be produced. Platinum melts in it like wax in the thame of a candle. Guartz, the sapphire, magnesia, lime, and other substimecs equally refractory are forced by it into a state of tusion. The lianmind when placed in it becomes white but, swells up, fuses, an! is redneed to a black mass resembling eoke. In this condition, it is still hard emough to seratch glass, but possesses almost no consistency, giving way to the pressure of the fincres. From an analysis of the spectrum given by the electric light, it is found to lee cansed not by the eomburtion of the carbon, lunt by its being hrourht into a state of incandescence. It is fonmel to abomal in vinlet rays, and is hence well aulapted fur photographic purposes. The electric light ean lue producd in a vacuum, and below the surface of water, wils, and other non-ennducting lirquils. It is thus quite impependent of the action of the air, a circunstance which may yet be turned tu useful aconmat. With a lottery of some fifty Jinnsens mements, a light is produced of very great brillamey; but when very great power is to De uhtimal. is well as inillancy, twiee or thrice that number unst le employenl. Fifty cells give an electrieity of the needful tension to proluce the luht; and if more be employed, they must alf to its strenerth, and mot its tension. Thus, if 150 edlls le nasd, they would he lust armanged in three lratteries, the positive poles of all three being joined to form one pusitive pule, and similarly with the urgative fules. With a battery of forty or fifty cells, nu [untine of the ronls is nocessary, is this is done by the action of the electricity itself.

Vimons armagements lave been invented for mantuininer the stenliness of the electric light. 'The aim in all suelh is to keep the earbon proints, by sume nachanical contrivance, within sncle a distance of cach wther that the enrent can pass between them. Fouranlt, aidul by lmbosen, was the first whar eonstructod an eloctrieal liun] of this duscuption. In it, hat an partly of an clectro-magnet, and partly if rack-work, the two points are made tor travel tumarrls wehothor at mates correspomding to tlase of their cornamption, the fusitise pole in this way traveline dintire than the merative. The relative distance of the puints, aml theit position in space, thus manan the samu. In the simpler form of elcetrie lamps nos" vonstrueted, it is moly sought wa kep the puints at the same distinere, the wastimg
 much to alter the alosolute position of the light. Smoner the su lamps, that of Dr llart of bidinburgh leserves motier for its simpliaty amd ellieiency. It is shewn in fier :2. 'Ther curent inters by the binding serew h, asemuls (hu hollow jillar k ly an jnsulated

 apparatus may be comsiedered as the pusitive fuld of the arramenent. The row $A A$, the low re part of which the stick of canbon ${ }^{\prime}$ ' is tixat, ments mo and down in the axis of the berupioce It gasses at Lí throush is forlow ayinder, which restes an the poltfinm 11, and hats its uppry part "art into two halves moving on hinges, which, whrn the whole rests on 1t, lie ontwards, and give the rond AD full phay to mowe up or down, when so ursel. Whem, bowever, the armature 1 b of the electron magnet is drawn mp ly the passige of the curvent, the ring I), which is dixed to it, and which cacircles the upper part of the split cylinder $\mathbf{E}$, brings the two halvew tugether, so as firmly to embrace the rail AA, which conse'lunutly rises with the ammatire: The rod AA is ronghened by cireular file-marks, to render this action the more certain. The current jasses from the frame of the electro-magnet into the rod AA, hy several surfaces of contact, then by the carbon point F to the oprosite point N , and thence loy the linding screw $\mathrm{L}^{\prime}$ to the battery. Thus, before the current circulates, the rod AA, and the point 1 ', rest by their weight on tho print N. The instant, however, this takes place, the ${ }^{\text {mint }} P$ is withdrawn to a sbort distance from N, ly the action of the clectro-magnet, and all the hrimizat elficts of the clectric light are producel. When the carlun rods, by their "wasting away, stand at length so far apart that the current canmit force its way from the ane to the other, the current being stomed deprives the clectro-mannet of its power, and the armature, in consequence, falls, and allows the point I to drop on N. The contact is the again seacweel, and $P$ is drawn up to its former distance from $N$. The interval that chapses between the breaking anit the renewing of the current is su short, that the steadiness of the light is not interfered with, a sudicn, scareely perceptille flinking leing all that indicates such an "cenrreace. The light contimues withont intermption till the positive carbon rod is exhausted, which generally takes ahont an hour, when a renewal at least of the positive rod becomes necessary. A lamp like this gives a splendiat illumination to the magie lantorn or the solar microscope, the lenses of each being made to slite vertically for a small distance, tor allow the contre of the pints to le lepet stways in the optical axis.

The attempts which have lreen made wabstitute the electric light for coal-gas in lighting up strests and public places, bave hitherto froved unsuccessin!. One element of imprrfeet success is to he found in the unsteadiness and short duration of the light. By contrivances similar to those deseribed ahowe, the light may le continued for a few hours, but

## ELEOTHIC TELEGRAPII. Sec Telemapit

ELECTEl ClTY, the name used in connection with an extensive amd in!motant class of phenomena, and usually denoting eithor the unknown canse of the phenmena or the science that treats of them. Nost of the phemomena in yuestion fath muler the three chief heads of kinetional Llectricity, Galvanism, and Magnetwhectricity. The present article is contined to the tirst.
 in his writings to the fact that anler, when rubluen, attracts light and dry borlics. This was ther only electrie fact known to tlue ancionts. The seience if clectricity dates properly from the year l6m, a. m, when Gillere of Golchester published a looks, entithen De Arte Moquetion, in which lue gives a list of sub-
 as amber, and speculates on mannetic and chectris forees. He is the inventer of the word rectraty. which he deriwad from the breck wort electom, anher. Otto ven fuaricke. burcomaster of Maride
 (160), descriles ammis his other inwentons, tho first electric machine erer made. Which consister of a glohe of sulplum turnell he a hande, and rablud hy a cloth pressed arginst it liy the hand. Haw lisbec (1709) constructinl a machime in which a glass cylinder, rulded tes the dry hand. rephaced fuericke's silphar globe. Citey and wi.her ( $10 \cdot 2$ ) were the firsty to transmit electricity from one pint to amother, and to distinchish lanlies intu combuctors and noncunductors. Infay (1733-1745) sherred the identity uf electries and nim-combuctors, and of mon-electries and enmothes, aml was tha first to discover the two kimbs of chetricity and the fumdamental principle which regulates then action. Eetreen the guars 17ai: and 174, nueh attention was riven in Ciermany to the construction of electric machines. Thetrethis time, motwithstanding the inventions of Guerieke and Hawksee, the glas tulue rublud by a piece uf elnth which dilbert tirst introduced, was usel in all experiments. Lome, a profossor at Wittenhors. taking the hint from Ilawkelness mathime, emplayed a glohe of athes for his machine, and furnished it with a prime combuctor. Vimlilet, a professor at Lapsie, was the first tor ure a tixenl enshion in the machin!. The Legden jar was ( 1 -46) discovered accidentally at Leviden loy Muschenloneds : lut the bommer of the disenvery has been rontested also in favour of Countis, a rich largess of that town. and

## ELEUTRICITY

Kleist, cannm of the eathelral of Comin, in Pomeranta. Franklin (1747) shewed the electric conditims of the Leyden jar, and (1-a) provel the ilentity of hehtuine and dectricity ly has fanous kite experiment. Thais last was berformen with the same aripet about the same time. and yuite inderumbently, by Romas of the town of Nerac, in France. In 1760 , Franklin male the first lielatuinserminctus. Cantom, Wilke, and binus ( 173.1759 examine the nature of imbetion. Liamsinen (1768) was the first to construct a plate-machine, and Nairn (1700) a two thit yhmler-machins. The electrophoms was invented hy Tolta in 175. and the combenser ly the same electrician in 15 s . In 17 AT , (tatuani mate the discosery wheh led to the addition of the new branch to the science which hears his name, ant which now far exceeds the der brach in extent ami practical valne. sue Galtanism. In 1757. (imulomb, by means of his torsion-halauce. investigated the laws of electrie attraction and repulsion. In 1837. Firalay published the first of his researches on iurluction.

Am designenl his hydroelectric machine.
Findmentil Fucts.-Under the bead Cinsmetors (c.v.) it is stated that lowies which do mot combluct clectricity, or non-compuctors, are capalle of electrical excitation from friction, and are, in conseruence, termed electrics, and that combluctors not so affecten are callem nom-electrics. The fombumintut principlts of electricity are illnstrated by the clectric jumluhum (ig. 1. A glass tulne bent at right angles, so as to maject homizontally, is placel on a conremient staml. an the look in which its urner end terminates, a cocom threal is hums. to the end of which a pith-liall is attached. The hall is thas doully insulateci hy the ellass and the silk threm. If a tuhe of class be rubbed by a thry silk hatkerdhef, and limotht meat the lall, the lall is at tirst luiskly attracterl,
 meved towarls it, it nowes alf, keeping at the same distance from it. The hall being so affected, or charsml, as it is callen, a roch of shell-lac or of sical-ing-wax, after being rulheal witls flannel, attrects it, it parsible, more lorskly than lofore and again semb it off "xactly as the ghass had choue. If the ghass
 time, if mexesary, the ball whll ant toward it as it dill towards the sealingwax. The same series of attractions aul repulsums would have taken Wace if we had han with the sealineron instend of the glass thbe. Whe materet this experiment in the following way. When flass is rublued with

 a pith-ball on any wher bight substames: and atter mantin't has whmumated this promery to the ball or other matar, repulsim takes phace hetwere
 dey an mandetmy theal, it motains the poperty
 repllal by a baty hation the same property, it is
 mathet inain takes phace and the promety of

again repul, anl the sane suries of attractions and repulsinns will continue if we present the glass and the wax alternately to the ball. These pronerties or affectims develnea by friction, are called dectricities - that of ylass is called vifreous clectricity; that of sealing-wax, resimous electrith, glass and resin heing the trpe-sulntances in which they are molncel. The electricities bere evolwal by friction can he pordued in a swat variety ni ways both mechanical and chemical, lint lonvever nleveloped, their characteristics are the same. For vitreous, lusition nul fur resinges, nuthere are now almost miversally substituted: and although these terms are meaningless as applied to two similar affections of matter, they have the adrantage of heing delinite, ant of having no reference to the source whence the Hectricities ariginate. They almit, moreover, of a very emwenient contraction, vize, the alcohraic + for pasitive, and - fur negative; and when writen in this way, their relative olnosition. su to speak, is graphically shewn. We are taught ly the above expermment. ihat bodies eloctrified either prisiticty or nemetirel!, attrout neutral bodies and brelies aftected with electricity of ane opposite nome to thei, oun, but repel those affected with electricity w the same nome; and that alectricity can be communicutad from one borly to another by contact. Contact is not the mly way in which electricity is communientel. We timl, when we deal with larger bolies than the pith-1sall of the experiment, and sometimes even with it, that the passage of a spath betwen two lowhes withont contact commmicates the clectricity of the on to the other. The part played by the rubbers in the above experiment must not he uverlodial. The silk handierchief employed to rul, the glass assumes the resinous or - eleetrical state, and the damel rubber of the sealingwax the vitrems ur + . This cannot, however, be clearly shews, as the experiment is perfornced, for the rublers are in eaclu case tightly embraced by the ham, which carries of their peculiar electricity, $s$, that they give fecble, if any, evilence of electrical expitement. Is the rods are held only by their extremities, the electricities of the nutouched portions sutiter almut no diminution. If, however, the rublures, as well as the rnbbed surfaces, he insulaterl. as they may le in the electrical madine, they show upmsite electricitios. The sime thing may be illustrated thens: two similar lises-one of mass, the other lirass cowered with silk-hehe by insulatimer hadles, are rubibel tosether. So long as they are kipt tonchines, no clectricity is shewn, for the opposte electricities nentralise each other ; but when they are suparatal, the former shews + , the 1atter-inetridity. Hence we conclude, that when one derfricity is jordurel, as much of the opposite chetricity is prombed.

The rolatise nature of the rubliwe and rubleal smfaces ductermines the kimi of electricity which tath assum.s. Thus, ii ghas be rubled beates fur instual of sill. it edectrixity is - instem of + . In the following list, wath henly, when rublbed by any one proceding it, is mosatimely electrifical: by any obe sume lin! it, poxitucly : "cats" fur, smontín glass, limen, foathers, wom, faym, silk, shell-lac, Tromblas. Whan two pretes of the same material are midnal tewther. the ander or smonther becomes pmatively a xpitm, Notal filings mbing acainst a flate of the sane metal idelermine

## ELECTRICITY.

on the inner, and the + elcoctricity on the outer surface. The divergence of the laves increasel as the ball was lowerel, until it sunk three inches below the opening, when they remained steadily at the satre puints. The ball was lomered till it touched the bottom, and communicated its charge to the pail, when the leares remained in the same state as before, shewing that the + electricity developed by iuluction on the outer surface was exactly the same in amount as that of the hall itself. He then altered the expriment so as to have four insulated pails insile each other, and the effect on the outmost pail was in no way altered. Here the action of the air letween the pails was in effect the same as that of the mails themselves, and if the molecules of air vere insulated conductors like these, they would have actel in no way different from what they dil. The action of the molecules of air, in certain circumstances, appears to favour the illea, that they are individually conducting. The discharge of electricity by spark throngh the air, shews that they can be forcel to aet as conductors; and the currents which procecd from points lighly charged with electricity, appear to indicate that they can be attracted and repelled like the pith-balls of our first experiment. It may he urgel acrainst the theory, that it is only shifting the difficulty; for by what medium are the molecules of air insulated from whe another and from other bodies, and by what means do they act induce tively on each other? But this objection relates to the molecular condition of matter, concerning which we are as yet ignorant. The way in which one molecule acts upon another need not be the same as that between mass and mass, for it is to be expected that the molecular relations of matter leing tinal, should have something peculiar. Molecular action, to which we must refer the phenomena of iminetion, appears to eousist in a polarity of ach mulecule similar to what we find in masses; but how that pularity is poparated, and bow each molecule is insulatel from tischarge, must at present be referred to the fimal nature or mroperties of matter. Accorling to this theory, then, an excited body is the centre of pelarisatim, from which a chain of polarised insulated partieles, Whetber of air or other material, proceed to sur* rounding uniusulated conductors in straight and curved lines. On the nearer surfaces of these it attracts the opposite electricity to its own, and repels into the ground an electricity of the same name and amount as its umn. The lealing idea in Farallay's theory is, not the repulsion of one electricity towards itself, but its cor-relation and attraction $t_{1}$ the opposite clectricity. Ehectricity is regarterl as a polar on double force, which nurer exhihits one only of its furces, luth being necessary to each other's separatiom and existence.

Faradiay considers that the molecules of a didectric durime induction are thrown into a certain [wlavel] comition, which is now of constraint. as it is only sustainco bly the action of the exciting lonly. The tron tension may the applied to this comdition; and when we speak of an rlectricity of high ternion, we mem an cledrepity of high constraining "r marising pover. which is "xhilited in its fored of attratima or rombion, and in the readiness with which it liseharges itself by spark. This is guite in kerping with the strict meaning of "tonsion' in general works we dectricity, where it rafors to the concentration of clectricily on whe spot: thus, if we give a chancull ball as much elecetrivity an it alroudy has, its whetrie temsion is said t. lue dombed. The constraint of the polarised particlos of at dindertric apmars to bu monamical as well as electrical, for when the pularisation rises to
too high a pitcb, their cuhesion is destroyed in a disruptive discharge.
Conductors, according to this theory, are bodies whose molecules have the power of communicating their electricities to each other at low tensions, whilst non-conductors are those whose molecules only accuire this power at high tensions. Wheatstone has shewn, as we shall afterwards see, that facility of discharge is not perfect even in the best conductors, as time is needed for its propagation, and it has been found that the terminal lamine of non-conductors between two charged plates, become pentrated with opposite electricities, which indicates the slow progress of condnction. The molecules of conductors aud non-condnctors, therefore, have the same power of mutual discharge, but in very different degrees, so that a good non-condnetor may be regarded as an excessively slow condnctor. When disruptive discharce takes place throngh a non-conductor, the molecules in the line of discharge seem to be thrown iuto a state of very exalted tension, and to effect the discharge as if they formed a conlucting wire.
Distribution of Electricity. - We might take it almost as a self.eviclent truth, that the greater the surface over which electricity is diffused, the less is its power or tension at any particular point, and so we are tanght by experiment. When two equal balls are insulated, and a charge is given to one of them, and then commumicated to the other by contact with the first, it is found that both eypailly divile the charge, but that the tension of the electricity of each is one half of that of the originally charged ball. When a watch guard-chain is charged and laid on the plate of an electroscope by means of a glass rod, the gold leaves diverge most when the chain lies in a heap on the plate; and as it is lifted ur, the leaves approach eacb other, shewing that as the exposed surfice of the chain increases, the electric tension of each part diminishes. We are thas tanght that a large surface feebly electrified, is equivalent to a small surface highly charged with electricity. This can be accountel for hy the theory of induction in the following ray. It is assumed that electricity lhaces itself where it can best propagate polarisation throngh the particles of the diclectric. In the case of the two balls, as each offered the same facility fur intluction, there was no distinction electrically between them, aud an equal distribntion necessarily took place. The polarising force, however unaltered in amount, having twice the number of dielectric molecules to act upon, ean only effect half the amomet of polarity in each. The same method of explantion may he ulonted in all such cases.
Axpuriment teaches us, that electricity is exhibited maly on the surfaces of onductors; this is shewn

by the apparatus represented in fig. 5. A brass bath is susponted ly a silk thread, and covered with two homispheres, which wan be held hy insnlatiog hamples and which exactly fit it. $A$ chargo

## ELEUTLICITY.

is then communicated to the ball se componded. When the homixpheres are withlatw, they are found to take away all the electricity, with them, not the slightest charge beines left in the ball. The same fact is exhilited ty ithoilnw ball piaced on a diass jillar, with a hole in the top large enough to admit a proof phane to the inside. When chargel, not the faintest evilence of electricity is fome on the inner surface, howerer thin the material of the ball may le. The thinnest metal phate, when umer induction, shews opposite electricities on its two faces. We leam from these and numerons other experiments, that dectristy is only found on the onter sarioues of conductors in an envelope of inappreciable thickners. This fact is quite in keping with the theory of induction, for pularisation cannot be propagated towards the interior of a charged body which eamot possibly offer the eorresponding opposite electricity, to complete the chain, and the outward polarisation can be manifestly best exerted on the very exterior, if we may use the phrase. This likewise acconnts for no electricity being fonnd on the inner surfaces of two gold leaves diverging under the snme charge.

We are also tanght, by experiment, that tho distribution of electricity on the surface of insulated conductors is influencel materially ly their form. In electrified bail, for example, exhibits the same tension on every part; and this we should expect, for there is no point par. wetlence where induction is facilitatel. This, bowerer, is not always the case, for when a conductor is brought near cnough to the ball, the distribution is disturbed, being greatest towards the disturbing body, and least on the side away from it. If induction were propagated from the bill in the sume way that light cmanates from it candle, we shouli expect that the opyosite electricity derejopert on adjoining surfaces ought to be of higher teasion than on those more remote, in the same way that a body held near a candle is more strongly illuminated than more distant objects. The eamile, however, does not shew itself hrighter on the side next the near olject-the distribution of its brightness is the sance as before. But in the electrified ball we have a crowding of electricity towards the near object; so that re bere learn a striking peculiarity in inductive actinn, viz., that it is most active where the dielectric chamel is shortest. This holls trac only for short distances: the disturbing body, for instance, in the ease maler consideration, bas to be brought very aear before any inequality in the distribution if electrivity on the ball becomes mimifest. It is to this conecontration of electricity on the side of the arproaching conductor that we owe the electric slark; and it is as we near the striking or sparking distance that this disturbance is revealed. The concentration or tixing of electricity on the side of the thinurst and best fielectrie, is particularly illnstrated in the Coudenser (q. y) and Leyden jar, whose action depends upon it; hut in these the dielectric must be very thin to secure deciden effect. When a conductor somerhat in the firm of a prolate spheroid (firs 6) is charat, and the electric tension of the several parts tested by the promi phane, it is fonm to be least at the thickest part, and to inmease towards either end: and the difference is fomat to be all the greater as each end becomes more and mise pointed. It is foum likewise that the clectrie tension on a point is sur great with a cousiderable charge as to destroy the dielectric condition of the air, the
partiches of which become electrifiod, and carry by convection the "haren: of the pint to surronding condictors. We therefore learn that dectricity concontrutes on prsints amb projections. This is guite is acerrdace with the thenry of imbaction. Supprse, for the instant, in the case of the spheresid, thite the distribution was "yuablo, and that the opmesite electricity was indured on surmombing whinetors, low would this react on the a lectricity of the spheroid? Let us compare the case of one of the small terminal surfaces with in correpmonding ine the midule. The yrometion of indmod surface acting on the terminal surface is much reator than the central une. This will be mall beter understome by suppusing a minrosemper pectator torstand in luth positions. On the ent surtach, he womble sen hearly ail the objects romal about exmpt the small portion hidden ly the shervid; wherens, on the midde surface, half of them is himba by it. What he sem in each prosition, is the: dmont of imbucel surface acting on it. Honce the electricity is drawn more towards the emds, to corresponi with the great inductive artion thore taking phace. The same consuleration acenants for the intense action of a point.

Lectrometios ment Electrosenpes.-These worls are generally taken as synongmons; electrosenmes, hasever, should be appicel to the inntrumats which give evidence of electrical excitement without giving the exact measure of it ; amd electrometers to such as sluw both. Fig. 7 represents the quentrant electrometer. It consists of a comduct. ing-rod, generally of box-wood or brans, with a graduated semieircle attachon alove in the centre of which is a pivot for the ratation of a straw carying a pith-labll at its outer end. It is usel for clectricity uf high tension, such as that of the electric machine. When placed on the 1 rime conlactor of the machine, the whole becomes charged with + electricity, and the ball is repellel first by the electricity

Fib. 7 . of the rod, and then ly that of the 1 mime cominctur, the beight to which it rives being seen on the semicircle. This is not an dectrmater in the strict sense of the worl, for althongh it tells us, by the straw rising aud falling, when we tonsion is grathen or less than amother, it does not toll us by hom much, the conditions of its raulsion being too enmplicated for simple mathennathal expressinn. ## ELECTRICITY.

cau lee well seeu with Winter's machine. The negative conductor being connecterl with the ground With a two-foot plate, we may alserve them in the following order. On turning the plate once or twice, a faint snapping soum is heard, ant, wheu the room is darkenel, a Hickering spark is seen to be thrown ont from the two-inch hall projecting from the prime contuctor, which has the form of a bush, without leaves, with trunk, branches, aud twigs, about ten inches in height. This is one form of what is called the bushe discharge. Its gencral direction is horizoutal, or not much inclined from it, but it turns to the land or other flat conductor brought near it. If it be received on a ball. its varions branches concentrate on it. If the brush proceed from the end of a brass ron, instead of from a ball, it becomes very much timinished in size, and resembles a lirush of feathers. The brush discharge, though apparently contiunous, has been fonnd by Wheatstone to consist of a series of successive brushes. When discharge is efiected from a point, a star or glow of light marks its termimation, while strong currents of air proced from it, which are strong enough to blow away the thame of a candle. These currents accompany more or less the variuns forms of the hrush discharge. The particles of air thus cany away the charge from a point to surronding conductors, and hence a point is sail to discharge itself by convection. If we comect the luass rod of the spark drawer with the ground. or the negative conductor, and bring the that ball opposite th the small ball on the prime conductor, straight brilliant sparks pass between them so long as the distance does not much exceed two inches. Beyond that distance, the sparks become somewhat erooked, and at about four inches the discharge begins to take the form of a brush. If, now, the ring be placed in the conductor, the sparks again pass with readiness, and the brush does oot again take place till the ball of the spark drawer is eleven on twelve inches off. The long sparks thus olotained with the aid of the ring are deciledly crooked or forked, with strongly marked lateral branches, which lecome all the more markal as they lensthen. It would thus seem that the spark has a temdency to Ireak up into branches. When the strikiug distance is suall, this is not perceptible; it is then straight and umdivided. As the distance increases, it is crooked, with well marked offshoots; and when the distance is too great, it splits up entirely into a bush or Trush.

The function of the ring of Winter's machine is therefore to increase enormously the length of the spark. This would seem to arise in the following way: quantity as well as high tension of electricity is requisite for the loug spark. Without the ring, the electricity collacted on the prime conductor concentrates on the projectias hall, but it cannot wather strensth enough to make a full discharge finto the neighbourines spark irawer, for before the quantity is sufficient, the tension of the clectricity on the small lall has pushed the polarisation of the molecoles of air to their utmost, and a partial ar overlow disclarge in the form of a brush ensues. When the ring is added, from its thinness aum prominent position, it diverts the electricity into it: and lefore the tension of the electricity on the small hall again rises to discharging point, a large charge is accumbated in the compoume eme flom:or, which diuds full vent in a powerful and rennentrated spark. The wouden envelope appars to ace to the wre as the oiled silk to the plate; it pervents discharge into the air. The influcnes of the laren flat hall of the spark ilrawer is of mpmanner; it concontratos, from its size, 11 w inductive action of the charge on itself, and from
its flatness it canout hasten a fremature lis. charge, Loag sparks do not necessarily imply a very fowerful machine, lut they guarantee good proluction of electricity, and an insuiation so perfect that no power is squandered. For the generality of electrical cxperiments, sparks of one or two inches are amply sufficient. These, W"inter's machine gives readily without the ring; and when occasionally long sparlis are wanted, the extension of the prime conductor can be addel without inconvenience. It might be supposed that while the long sparks pass, the machine works more powerfully than at other times; but such is not the case, for the loug spark occurs only occasionally, and the short one almost incessantly. All the forms of disrnptive discharge are accompanied with the peculiar electric odom which arises from the production of ozone ( $q$. v.).
We may now make a short reference to the experiments performed by the machine, illustrative of the general properties of clectricity. A wooden head with hair on it illnstrates, when phaced on the prime conductor, electrical repulsion, by the hairs standing on emd. I spoon coutaining ether is held so as to receive a spark from the projecting ball, when the inflammation of the ether illustrates the heat of the spark. A man standing on an insulating stool (a stool with glass legs), with one hand on the conductor, cau seml sjarks, with his other hand, to everything and cveryhody nbout him. This illustrates communication of electricity by contact. A few pith-balls are encloset in a glass jar, having its tol aud bottom of metal-the former in connection with the prime conductor, aud the latter with the gronnd, when the pith-balls, by their rising and falling, shew the attraction of unlike, and the repulsion of like electricities. The most extraordinary experiment that can be performed with Winter's machine, is the lighting of a gas-jet by a person wholly unconnected with the machine, and staudiug some eight or ten feet from it. If the person so situated holds the blade of a knife or "ther point over the gas-bumer, at a distance only short of tonching, at each long spark from the machine, a small smark passes between the blade and the lumer, and this ignites the gas. The reasou is as follows: The boty of the person in question is electrified negatively by the extensive prime conductor of the machine acting inductively. When the spark passes, the electric tension of the riug falls, and the negative electricity of his body must returu to the ground, and taking the casiest route. canses the spark in question. This is quite similar t. what is known in thmoder-storms as the back stroke. A person in a prominent position, under a lighly charged clond, experiences a violent, sometimes fatal shock at the same time as a flash of lightning, althongh the thash was not at all near him.
Leylen Jer.-This is a glass jar (tig. 14), with a coating of tinfoil pasted carefully inside and ont, cxtending to withon a few inches of the mouth. 'l'his last is wemerally closed ly : woomen stappry, through which passes the stall of a brass knob or hall, surmomenting the whole. The conncetion between the inside eoating and the ball is completed by at chain extending from the stalk to the bottom of the jar. If this jur he put on an insulatines stued, so that sparks can pass from the prime conductor of a machine to tha knob, when the jur is thas insu-

Fig. 11.
latel. one or two sparks pass, and then the charge secms complete, for no more sparks will follow. though the action of the machine is continucd ; or

## FTECTRIAIJY.

if they do, they are immediately dissipation from the knob in a brush discharge. If then, however, the kmoklo of the exprimentur be lionght wat the outer roating, sparks begin aging to base fredy; and for every spark of + clectricity that pasias lectwen the machine and the knol, a convermmens spark of the same name phasses lectween the know $\cdot$ ke and outer coating. 'This contianes for some time, and then the jar appears to be again saturate if. It is now said to be fully chargel. The outside of the jar ean, in this state, be handled fremely, and if it be stith on the insulating stom, so may alsu the knob, althogh, when the hand first approiches, it receives a slight spark. But if, when the experinenter has one hand on the outer coatime, he bring the other hand to the knol, liefore it cim reach it, in straight. highly brilliant spark passes latweon the kimb amed his hand, and he expri-

Fig. 15. cnces a slock of great vinhence. If he try the same thins arain, a fecble spark and shock wain chsue, and the jar is now thorounhy diselrarged. As it is highly inconvenient, if not langer. ons, to discharge the jur through the body, dischurefint tonge (fige 15) are necd for that purpose, which consist of two hrass arms onding in lalls, and moved on th hinge ly glass hamiles.
The following aceount may le given of the action of the jar: When a spark passes between the combuctor and the knoh, the + clectricity wercly commonicated to the inner conting inluees 1 wi. arity in surrounding conductors, the - electricity being turned towaris itself. From the knob, it can act upon a wisle but distant range of combuctors, through the air as the diclertric; and through the glass as dielectric, it can act upon the outer conting. Now, as the outer conting is wery much nearer than other conductors, and as glass is a Jetter "lielectric than air, by far the most impurtant dircetion of induction, when the jar is unimsulater, is through the glass. We have, therefore, the electricity given to the knob and inner coating dividen, as it were. into two inducing charges-une to the further conductors, and the other to the merer coating. The former of these we may call the free charge, as it acts in the usual way throngh the air ; and the latter, the bound charge, for it hats a special conductor and dielectric. When the jar is insulated, we tind that, after one or two sparks, it refuses to take more. This comes from the onter coating refusing to be further polarised, or, which is the same thing, the insulated electricity can more casily transmit polarisation to surrounding conductors through the knob than by means of the + clectricity imiluced on the nuter side of the outer coating. When, however, the outer coating is connected with the ground, either by spark or contact, the polarisation can reach its final termination, the ground, much mare easily through the thin sheet of class than through the air, so that every spark that the jar now receives goes, for the most part, to the bound charge, and a small fraction only to the free eharge. What goes to the bound charge must have a correspomling electricity on the untside coating; and for every amount of - clectricity thus fixed on the water coating, a corresponding amount of + electricity must he sent from the outer coating, either silently, when in contact, "r ly spark, when nearly so, intu the ground; and what goes to the free charge has its - electricity imperceptibly induced in surromel. ing conduetors. The jar thus reccives rather more + eleetricity inside than - electricity outside; the
 of the thet - Alectrinity imineod. After a fow more turns of the phate, a second limit is rachai, and the epmlis refuse anain wither to trawion or t',
 easis Thamel for abductinn than the gha- the" partinles of which now our mare resistance to further pulari ation than thase of air to a limerptive diselnare. 'The thimu the ja is, the lunem mate

 coating. The free charge wold mot romentently exist, and there woulat i, ne limit to the chare which the jar cond receive I'ractically, hawerer, we must mak" our jans of whm thicknes, ami that we lind must mot he tow, small, for as the ghass at thimer the pudarisation of its particles rises hiohort; and whes it is tow thin, the jularisation rises higher than the culuesion of ita particles can lear, and a disroptive discharge taks phace thromg it. Suth a spontencous dischurge smotimes neeurs with revinary jars at their thmmest part; and as the fractme which it there causes in its jassare makes the jar uscless, it is usual nout to charge a jar to saturation. The bean-ideal of a Leyden jar would be one whone dielectric wats of axessive thinness and insulating fower, a comlition manifostly mattainable. The two charges are bumd liy imutual attraction to eacle side of the glass; lut if luth contings and Le simultanesusly removed, as in the combensor, cach wald give strikine evidence of its hiob electric tension. The ontaide esatin's can be toncherl without shock. for tho - lectricity is next the glass, ind the + rhectrisity has lipen lost in the grome, of which the outer surface of the coatinu, as well as the hamp, furms a part. The immer conting, or its representatise kaob, may not lie tomeder while the jar is uninsulatel, fris the discharge of the two coatines whull he ettectond through the ground and body. When it is insul-
 a small spath, arising partly from the ducharge of the free chares, and partly of a minute pretion of the bound charge, arising from the nearness if the hamd at contact increasing the amont of the free charge at the expense of the previonsly buand charge. The elentricity is, as in the case of the - uter coating, next the glass: and the linob and visille surface of the inner coating forms as in the former ease, a prortion of the wromel. Bint. the minute loss of hound + electricity from the inner coating laves a corresponding amount of electricity free in the anter coating, which, when taken away, is, as hefore, acermpanicil ly a minute portion of the hom charge: and thas, while the jar is insulatod ly touching alternately the knoh and the cuter coating, we wratly discharge it. When we wish to discharge the jar with the tonge, we phace we ball on the outer coating, and brinis the ot ther round to the knoh, when the diselarging spark takes place. The length of this spark is many times lunger than the thickness of the glass, which shews that a discharge takes place more easily through the air than through a glass phate of much inferior thickness.

On bringing the hall of the tongs, after the first discharge, nearer to the knol, a feehlo secondery discherye follows, arising from the electricity whieh, under the intense action, had penctrated the glass, in th. endeayour to force a conducting passage through it, being partially left in it. It is to this state of conduction into which the smfaces of the glass are forced, that we may attribute the fact,

## ELECTRICITY.

that the charye appears to lodge nume on the glass that on the coatimes, the latter merely servims to ail in civine eombletion to their semi-comlucting state. This is usmally illustrated by a jar with novalde cuatings, which, when charged, can he talan to pieces. The jar heing insulated, the inner coatime is first removel, then the jar is liftel from the outer coating. Both coatings heing completcy diseharged, the whole is again put up, and a dis. chare of sery considerab, power is oltaned.

With respect to the striking distance, or that thromb which the air-discharge takes mace, it has 7 con frumithat it is propertional to the ammont of the charge, amb insersely proportional to the extent of the roatings. Thus, when a jar is half charem, the strilines distance is half what it is with a fall charge ; and to keep the same striking distance for a jar of twice the sizc, a domble chare is necessary. The amment of the charge is corpedy chomsh knisw hy the momber of tums of the plite of the machme. When ereat securacy is wanter, the outer coatine of the imsulatel jar is mate to spark into the knolo of a small jar, whose outer coating is connected with the gromil, and whel is semmle that jts two watines cin disharge themselses. Ench diseharge of the small jar measures so much electricity fixed on the large fir ; such a measurer is demminated a zuit jon.

Fir areat power, laren surfaces are necessury This ean be whaned either ly comstructine a large jar ur ly mitnar several small jars tugether, so as to act as rome. The latter methent is prefrable, as wo Gun wary the surface acombing to the nomper of jats comporye. A combination of small jars

Irluritmof Etratricel Miseturon.-The ramdity with which electrical discharge takes phace is so great, that we might well ilespair of reaching any detinite information about it. Wheatstome, ly means of a revolvine mirror detormincel its rate of propagation in certain ciremstances. A small mirror was made to revolve fitty times a secombl, and the reffection of the electric spark was obsured in it. Any me who thkes a mirror in his hant anm makes it revolve, sees that oljocets are apparently displiceed hy it, and it ahmits of an easy geometrical demonstration, that the reflected image descrikes an angle the double of that of the nirror. If, while the small mirrer rotates at this rate, the imare of a spark slonhd shew a disphacemat of !of we kinw that the mirror has moved through 4n, and the time during which this takes
 if the spark, then, lam buan ano of a secomel, we hwah have sucn its imagn mose through 90. 'Tho "he", hawerer, dumg this time would not have leen able toriser ru any diffrrence betwen the hegming and the whe of the spark. se that the 90 would hate apleaned as ome are of lisht. Cxamined in this way, however, the spark of a machine and of a Levilen jar wher sem as of the mimor hal bern at rest. "Mhes amalysed with an apyaratus where a chation of

 curresponds to ass, wot miles prer secome : greator than the velocity of liyht, which is 1031 y ja4,0010 mites fer secont. In the same mamir, it was alalated from the lensths of the ares, which ware "4, that the duration of palla spark was mot of of secomb. It thas afyened that the diseharg was a shecessive ona, not, at least, as instantamems as through a shont emednetor. This prodigions velomity is ruly that of discharge, not that of clectric action. The finct of both side-sparks oceurrines at the some instant, shews that infuction must have leron fully 'staldishel alung the whole have tofore discharge low plate. One would iname, firm the dual mature of electric foren, that the veloeity of inductow must windefimitely great.
Ehetric theories.-There are two thempins which have played an important fart in the histury of the seience-the two-daid thery of hatay, and the one-flum theory of Franklim. iecomdine to the former, matter is pervalol with two hinhy chatic imponderable cleetric fluids-ane, the ritrems; the other, the resinolls. These are supposed ti repel themselves, but attract rach ather. Nemenal lombes give nu wislene of their presence, fom they are there nontradisel the one hy the other: foit Whan fry frictom or wher opration the thaids are scmarated, each haly whserws tho attroctimas and repulsions of the flam it haprens tor hawe. Areosinge to the latenr, there is mily tmate dectric Whin whech repels itself, hat attracts matter. Priction determines a grin of tha Hand to the pusitive, and a loss to the nemative bumb: "of the two tharies, Dufay's is generally fuedered, becanse the perfect similarity of eake . Ifectricity, separately cousidered, is better represmat by two similir dhats, tham by a duid on the one ham, and matter on the other. Either thenry can gise a graphic explanation of electric phemment; hit thas does not necessarily innly their truth, for any themy Which made allowance for the domble nature of electric force could mot fail to be in some degree satisfactory. It is extremely questionable whether clectricity is a fluid at all. It is true that the distribution of electricity on the sidfikes of anductors is that of one of the llinids suppesent; lat to act as a thud, and to be a thid, are two bery dillerent things, and something lawe is meviod tham mere analogy to prove electric hnindty. If sum a fluid existed, we might expect to have some traces of its separate cxistence; lint experment teachas hes that electricity is never manifester on transuitted apart from fomlerable matter. It is diflicult to conceive of thands of the mature supposed. They are, in fact, ruite as peculiar as the phemomena which they are intembed to explain; stall, the science of edectricity is sery much indeletel to the supposition of its fluadty. It has served tu lexsm the ibstractions of the science, and to simplity the comprehension of ithenomena, much in the situe

## ELECTRICITY.

nervous contre of the electrical apparatus is, therefore, the mofulla oblongrata. Several species of noweine are linown, all of which possess the electric property.

The urdinary rays and skates possess an organ in the tail which closely resembles the electric orsan of other fishes, hat its function is still doubtful: and in opposition to the view of its electric nature, it may be mentioned that while Dr Starke (to whom the diseovery of this organ is due) found it in the tail of every species of true ray, both Irofessor Goodsir and MI. Rohin ascertained it to be wanting in the tail of the torpedo.

The Crymnotus electricus, or electrical eel, is little inferior in celebrity to the torpelto. It is common in all the streams which tlow into the Orinoco, and is gencrally procured from Surinam. It is usually three or four feet in length, hut may reach a leugth of six feet. The whole of its riscera lie close to the head, and the anal aperture is only two inches he himd the month; all the rest of the hody inferionly is oceupien hy the electrical apparatus, which consists of four loatteries-viz, two on either side, and one above the other-the uperminst or dorsal being the larger. These batteries consist of a number of piles piaced horizontally is a direction from head to tail; and from this cirmmstance, as well as from their peenliar structure, they were enmpared by Fedi to galvanic trouchs. The number of these piles in the greater lattery, is from thirty to sixty: in the lesser, from eight to fourteen. These batteries are supplied by about ong pair of nerves on each sime, derived from the inferior or motor ronts of the sinal nerves.

Humbellt, both in his Presonab Narratire and in his Jiens of Joture, gives at graphic acconnt of the node in which the Inlians catch wild horses through the arency of the gymmotns. Faraday male numerous olservations on a specimen, forty inches in length. which was exhibited in the Adflaide Callery some years aro. He calculated that, at each medinm ilischarge the animal emitted as great a force as the highest charre of a Leyden hattery of fifteen jars, exposing 3500 sciuare inches of eonted surface. The strongest shocks were oftained hy touching the fish simultancously near the head and near the tail: scarcely any shock leing felt if the hands be phacerl. ane on ench side of the fish, at the same fistane from rither extremity; the amount of the shock, ats might have been expeeted, varying with the londth of the column which produces it. The shocks have sutficient power to stum, or even to lill tish: and the same discharge produces a more powerful - Hect upon in large fish than it does upon a small one, since the larger animal exposes a larger conAncting surface to the water, throngh which the Hectricity is passing, amd, consequently, it reccives a mane violent shock. On one occasion, when a live Hish was put into the tul, which was 40 inches in diameter, the anman was seen to coil itscle into a semieircle, the fish lyiner across the liameter; this was the most favourable position for wivin the stroncest shock; an instant afterwards, the dish floatend lead upon its sidn, and was then devoured by the (iymmotirs (1. s.).

The shack of lenth the forpolo and the ammontus gives rise to momentary currents of sufficient intensity to aldocet the galsammeter, to magnetise a necolle, and to elecompmse ionde of potassium ; and from luth fish, sparlss have lawn whtained.

We moxt come to the cleatrial tishes of the genus Matuplerurus. The only lish of this \&uns whose Wectrod ortats hove heen exmmed and deseribed, is the Mr. Nectrims of thw Nild, walled laash or Thmanderish ly the Aralm, it has barbales dependont from the rerion of the month, like the common 6.2
larbel: and its smonth skia is diversificd with irregularly shaped spots. Its length is from cight to fourteen inches. The batteries are two in number, 'separated,' to allopt I'rofessor Croodzir's description, 'lout at the same time intimately connected to one another in the mesal plane along the dorsal and ventral margins of the boty, so as to form a continuous layer of a glatinous consistence closely atherent to the skin, and enclosing as in a sace the entire animal, except the head and fins.' The structure of these latteries is very compleated, and we shall not attempt to explain it.
In the year 1554, a new electrical fish became known to us, lelonging to the same genus as the one just describer. It is found in the muddy brackish water of the river Old Calabar, which emptics itself into the Bight of Benin. The fish has, aecordingly, becn maned the Mrolapterverus Beninensis liy Mr Andrew Alurray, who has deseribed and figured it in the Etinturgh Philomphical Journat for . Tuly 1.5n. It is much smaller than the Nilotic species, and the formule of the number of fin-rays differ in the two species. We believe that this new sprecies has been dissected by Professor Goolsir, lut we are not aware that the results have heen published. See Malapterities.
Our limits will not allow of onr noticing the snccessive opinions which hare been entertained regaring the action of the electric organs in fishes. Those of our readers who wish to investigate this abstruse subject, may be referred to Professor fromlsir's memoir, 'On the Present state of Organic Fhetricity,' in the Edinhurgh Philosophicul Joumal for octrber 185. We cannot conclude our notice of electric fishes withont directing the attention of our readers to an extremely interesting memoir by the late Professm Gence Wilson, 'On the Electric Fishes as the ealliest Electric Machines employed by Monkind,' which is contained in the Edintinuzh Philosophical Ioumal for October 185, in which be discusses (1) the antiquity of the practice of using the electrical fishes as remedual agents, and (2) the extent or generality of that practice.
2 . The sturly of the clectrical properties of muscle aml werve dites from the period (1756-1794) in which tralvani made his great discoveries. Ilaving tirst ascertained that eontractions were produced liy electricity in the muscles of a recently killed frog. he sulsequently foum that similar contractions occurred when two dissimilar metals in contact with one another were bronght in contact with the nerve and muscles respectively of the frog's leg. The experiment may be reakily made in the following manner : Expose the emural nerve, N, of a recently killed frog; tonch it with a strap of zinc, $Z$, and at the same time touch the surface of the thigh with one curd of a lit of conper wire, C . At the moment

that the wherem of the wire is brought in contact with the zine, tho lomb is convulsed; hat the eonvulsions cease when there two metals are seprated from wach wher, floweh they arn still in contact with the :minal tissues: and they are renewed when the sine and copfer are again made to tanch. At first. Gialvai believed that the eontractions were due to electricity crolved liy the

## ELEOTGITIJY'

metals, Jut fimally he concluded that it is prolured by the animal lextures themsolves. No important step in this direction was afterwards takon thll 1827, when Nohili, with his improwed Galvanmenter (1. $\because$ ), wisenverel the anetrie currint of the freme He found that when the eirenit of the nerve amb museles of the ley is closed by the instrument, a deviation of the werdle, to the extent smactimes uf :310, oceurs, due to a enrent which passes in the limb from the toes upwards, and which cond he increased when several frogs were simultanously incluled in the experiment. Indoulted proof was thus afforded that electricity is developed in connection with muscle and nerve.

The researches of Matteucci, confirmed by the sulsequent iuvestigations of Dubois licymont, have demonstrated the existence of what is termed the wuscular current in liviner animals. They shew that in the living animal an elertrical current is perpetually circulating hetween the internal portion and the external surface of a musele-a current due probahly to the chemical changes which are always occuring in the animal tissues. This muscular current coases in wam-blooded animals in a very few minutes after their leath: but in coll-hooded animals, as in the frog, it continues for a mueh longer perion. The following is perhaps the best experiment for shewing the existence of the muscular current. Five or six frogs are killed by dividing the spinal colnmon just behind the head; the lower limis are removed. and the integuments stripped off them; the thighs are next selarated from the legs at the knee-joint, and are cut across transwersely. The lower hatyes of these prepared thighs are then placed upon a warnished board, and so armanded that the kneejuint of one limb shall be in contact with the transyerse section of the next, and thus a musenlar pite is formed, consisting of ten or twelve clements ; the terminal pieces of this pile are cach mate to dip into a seprarate small carity in the hord, in whieh a little distilled water is placed. If the wires of a sonsitive galvanometer lie attached to a pair of Matimum plates, and these plates le plaeed simultonenusly, one into each cavity in conncction with the musenlar pile, a deviation of the galsanometer neede will be olserved in a direction which indicates the existence of a current passing from the contre or cut transwerse surface of the muscle towards its exterior.

Duhois Reymond has subsequently shewn, by the use of extremely sensitive instruments, that even the smallest shreds of muscular tissue exhbit proof of the existence of such a eurrent; and he las established the general law, that any point of the uatural or artiticial longitudian section of a muscle is positive in relation to any point of the natual or artifieial transerse section.
3. The electrical relation of membranes and glands have been especially studied by Mr leaxtor, Whose 'Experimental Luquiry, undertaken with a Tiew of aseertaining whether any or what sisns of Gurrent Electrieity are manifested during the Organie Process of Sceretion in Livins Anmals.' is mblished in the Philosomecel Trunsactions for 1 sts anl 1852.

Ifs chiof conchusions requaling the chatrieal con. dition of the intestinal mocons membrane are:

1. When the elcelromes of a galranometer are hrought into commmication-one with the mueons membrame of the alimentary canal, and the other with the blood flowing from the same part-a reviation of the nedle takes place, indicatines that the mneous secretion and the llood are in opmsite clectrical states.
2 . The effect conses after death, and may he considered as arising from the decomposition of the
hand vi\%, form (how hanere which owtur hations
 b, $1 . .1$.

 mammary hland, are as follow:
2. Daring mhary secection, the hilu amb the venoms bow flowing from the hepatic vans an in "pposite electranal states.
3. Durine urinary so chetion, tha mine and the woms home flowine fron the remal win are in opmosite detrical status.
a. Haring manmay sometion, the milk :and the whous blom flowing from the mamary wins an" in oppositu electrical statis.

For farther information on this snlijnet, the
 Thysicul Phenomone of Living lerings, trmalatal ley Dr Percira; to his series of "Elactro-I'hysinngial liescarches,' pulbishod in the Philusepllimel 'romenetions; and to Dubois Ihamond's Chersumbnyru "uber Thier-Elpetricitü.

ELECTRICITY, MLDOAT, Ehetricity, in itz aplication to numbere and surgery, is empteral in the following forms: I. Dherfagution, by electraty of high tension, as oldamod loy friction of glase in the common electrical machite ; -.. Sidhmivation, ly anment eloctricity of quantry, ins set in motion liy
 or interrupted coments, produced ly manetochectric or electro-magnctic ind luetion coil machine.

Dtectrination.- Frietional clentricity is mow sehlom employed in therapnties, on acomat of the inconvenichce experienced in the manasmont and insulation of the ofass of common alectrical machines: vet the fowerful stimulant aml conuter-irritatus: effect of sparks drawn from the aftectes? parts is still recommemed in paralytic affentions, in Chma and other nervons diseases; and the snecussion proluced hy shocks from the Leyden jou is undoultally the most effectual remedy in Amemornata.
Golemisation.- The effect of passing a viltaic current from a battery of many wanconts thromeh the living boly, is to cause a shoek or contraction of the muscular tissues, suceaded with a distinct interval by a momentary sensation or flow of hat due to the electric and nervous (i) pharisation of the eirenit. During the continmel passage of the current, slight tinding sensations and clevation of temperature are rhaserved. especially in those parts
 minind and congestal, and finally inflamed and nfecrated. On minning the eirent, the depolarisation of the tissues which ensues is accompanied by a second shock and subsequent ghw ut heat. whieh are [owerfal in proportion to the length of time the circuit has remained closel. The amome of antraction in the muscle has relation to the intensity rather than the quantity of clectricity passud throngh it-that is, to the rapidity with which the electric state is changel. rather than the amount of that change. The calorifie effect of the current is poportionate to its quantit!. Thus, a single pair of plates of phatimum and zine. an inch square (charged with dhomic acid), will, under malinary circumstances, exereise little or ${ }^{\text {no }} 1^{\text {thysiologia }}$ offect; but if the same pair be dirimal, so as to form a compuma battery of twelve smaller pairs, ita aplication will lee attenlel with the shocks and ealorifie effets describel. A further division into twenty-fonr wion mirs increases the shock. lant the sensation of heat lecomos less markent. With certain limitations, therefore, the shock of the battery depemis on the number oi its elements, withont regarl to their size. its caloritie effect to the area of its phates. The nerves of the organs
of srecial sense，when suljected to galvanisation， vitcnee phenonema peculiar th their proper function． Thus，the passige of the curent through the retima is attended hy the sensation of a thishof light，which is hanish whon the positive pole is appliet to the eye，and tingel with the comblementary ormge when the foree is transmitted in the＂prosite ohrection． A faint sensation of light is alson pervered when the skin of the fice or muenis membrame of the month is 1 alvanisel，cansed lay reflex action from the sentient filaments of the fith pair of nerves which are dii：trilmted to those parts．Gialvanisation of the ear gives ise to holding riuging，of crackius somuls， and necasioually to distinctly musieal tomex；that of the tomgue，to an acill taste mader the pusitive phe，and all alkaline taste under the＂husite me； that of the lining membrase of the wase，to sacering aur a prenliar smell，which dith irs with the direction of the eurrent．The continums sintle action of small single and componnd veltaic armaments hi：is tuen mocre or less sucessfully cmplayen in paralysis，mamosis，and neuralgin，wther baydica－ tion the the surface of the horly，or carried directly to the afficetell parts hey necilis thrust intu thom
 sisting of six or cight cells of the carlom hattery of limusw，the nitric acis liattory of cirove of the 1ditinised zinc battery of sitretliall Whight． have heen used to cragulate the tilrinus contents if ancurisual sacs－ti）deompmase calenli in the hamber（：）－and to rember phatinum plates or wires incaudestent，ior the surgical cauterisation of internal purts nut othorwise casily accessille．
Pinentisation．－The jnstruments emplayed for the exhilition of iutorruptel ir inducel cirrents are the magneto－electric and the electromantic eril nathen＇s．In the first，the deetricity is set in motion in a loug thin wire culled mond in baw of irw or kectror mantingen in constant whirling mantion Before the poles of a primanent lurseshoe－magnet， the magnet with ewry half revelution magnetising 1twe keeper alternately in＂phensite directions，while the constantly recming magetism of the keeper in its turn induces impulses of alternatine mornts in the coil－wire．The disalvantages of the mag－ motiolectric machine therefore，are，that it is not aulfactinge aud that its currents pass alternately in ongmite directions．In the clentromagucti－ madianc，the thick coil－wire，wound wer a care of iron，is malo to combuct the current frun a sinule valtaic peir which maguctises the irme．Whan the loattery－current is interrupten，the irmo cirp luecones histantly demagnetisul，am！this chauge in its nadantic comition is attemind with is rearranme an ant if the pralirity of the crib－wire，and the pansime

 Magnetor Fowntome.
 of at mond filleal wath shell lite aml at mathe mutn cover, with is Hhas hamelle ins shown in) the dientre: 'The shotl-tac is ponmen in Whan meltal, ind it is mixed with smme where shlostames tu makn it less hrittle. Fin⿻ pats of sholl. lim: whe of wax, ame? 010 of Venie. turpor time, is given als a (Hum mixtime When used, the surace uf tha cake of shell lac is martly heaten with a cat's fur or foxtail. The coser is then I mat on, and touched with the fingre, whin recomas a *hent spark uf - Moctrivity, just befome contivet take phace: and after the finger is remosed, the cover, when lifted by its insulating handle, wiw's a brisk spark of + electricity to anything mesenter to it. This can le repuated for several minutes withont any apparent exhanstion of the sonnce of clectricity; and in dry wather, sparks can le gent in this way loours, and frempently diva, after the (ake has been leaten.

The action of the electrobloms may lon thus accounter for. When the surface of the cake of sherl-lac is beaten, the friction expites - wectroty on it. This acts inlnctively all romm, lont the tin mond beine the nearest conductur, and sholllae is gond dielectric, the induction beenmes concentrated on it, + eleotricity beemming tixed on the sile next the sheth-lace and - whetrieity lemen sent to the gromel. The - vectricity of the urper surtace of the shell-lac is thas fixerl loy the + electacity of the monla. When the enver is pat on the cake, the contact between the twis is mot sudbient to allow the latter to communiont: its Whare to the former. The cober is thas aremt on inductively, mot condnctively. The - elnetricity of the cake, then, has the chaise of two chandels for its inemetion, wither thromen the wak the the mald, ine throush a very thin diln of ail to the cover. The latter, from its uffring so shat a passace throngh the dielectric, has the freference, and the moluctive action of the charee is divertel from the mould to the cover. and the + electricity om tha" other side of the cake is thas liheraterl and lust in the grombl. The enser luing strondy phlarisiol. + electricity is induced ami fixed on its lonem surface, and - electricity on its upher, this last kuing transmitted to the sroum loy the finger. When the finger is withlrawn, and then the cuber, the + Clectricity of the lator is free to lischarece it sulf lag spark, and imluctive action again takes the lirection of the mould, onee more attracting + Whetricity to it. The induced polarity of the coser is attembed with no less to the charge of the shell-lac. Which can thas continue to act with the same efficieney. The loss of electricity that all eharged lomlits experimen in air, and especially when moist, at lencth discharges the cake. but this takes place all the less readily, that when the wectricity is not meeded to act on the cower, it is kept bound ly the + Mo.etrib. city induced ha it in the mond. In urder that the + electricity of the mondel should have hiberty, so to speak, to come and wo the clectrophras mist mot be msulated: and when it is so, the action on the cover is feeble, if at all perceptible.

ELEME YTAL SPl'RITS beings who, aceme ins to the popular bolef of the midule ages, ]resided aver the form 'elements, living in and ruling them. The dmental spints of tire were called sala. manders: those of water, Cudines: those of the ar, $\therefore$ Ifhs; and thuse of the earth, Gnomes. These
imacinary beings play a jort in Pope's mock-heroic 1"um, The In的 of the Lock.

ELEDENTS, in Astromy, are those numerical quantitices, and thase principhes deduced from astro nomical meservations and calculations, which are employed in the construction of tables exhibitim: the plantary motions. They inelude the greatest. least, and minan distances of the planets from the sum, the eccentrieities of their arbits, their mean motions, diuly and anmal, with the nutions of their aphelia, an the inclinations of their orbits to the celipitic: their masses and innsities, \&c. The elemunts of the different plancts and of their satellites will $l^{2}$ from under the ir nans. The reader will find tahles of the elements of all beribes in wir systom in mont hooks on astronomy. See in particular Herschel's Elements of A stronomy.

ELEMENTs, Chenmen. The word elements has a very different signifioation in monlern scicuce from what it once hail. The earliest of the treek 1hilusophers assumed either a single clement, or several, the molifieations and combinations of which they heh to give rise tor all the things that we see. The most common assumption was that of four clements-fire, air, water, and earth. This corresponds to the fonr forms under which modern science considers matter as existing-viz. im[wnderable, gaseons, liguid, and solit; while by elements are understond the simple componerit incredients of bodies under whatever form they exist. Noither air, water, nor earth are elements in this sense, for they can he decompused into simpler ingredients, and fire is a comlination of light and heat. It is not pretended that any of the substances called element: are alisolntely simple, that is, contain only one kind of matter; hut only that hitherto they hase unt been recomposed. The mumber of so-ealled simple lodies, or elements, recomiserl by chemists at the present time (18fil) is 63, of which sume have heen known from aucient times, such as the metals gold, silver, leal, enprer, tin, and mereury: others are of more reent date; whilst withim the last year, two new metallic elements have been addel to the list-viz, Coesimm and liuhitimm, both of which were discovered hy I'rofessor Bunsen of IEeitelleres, by the ait of the new hranch of practical chemistry mamed sypetrom anulysis. 'The elements are divaded into two great classes-the non-metals and metals. The latter are the more numerous chass, there being altogether 50, whilst the non-metals number only I3. The following table gives the names of the elements at present known.

## rable of the elementati substances.

The more rare elements are printed in italics. Althorbt the classitication adoped above is it convemunt me for the stanly of the elements, yet there is no decided line of demareation luctween the metallic and non-metallic (otherwise called nuctalloinl) series. The metals are sencrally recosmised (1) by their purer of reflecting light, as exhibited in the lustre of burnished whe and even in ordinary mirrors, wheh owe their l"mer of rethecting light to the ammalam of the metals mereury and tin, present on the ghass ; (2) by their power of conducting heat: and (i) by thoir ready transmission of electricity. The mon-inetals or metallinds are regarded as not possessing all these thre attribntes. The nonmetals carbon and silieon, however, in certain forms eonduct eleetricity, whilst the metals arseme and tellurium rety dosely resemble the metalloids in many of thei properties. In the eombinations of the varims clements with each other, the nonmetals constitute the electro-negative ingredient, and, as a mule, are insulators in the galvanic current; whilst the metals form the clectro-positive clement of the combination, amb aro conductors of the eleetric tluid. Again, in their eombination with oxygen, the non-nnctals fom nome or less powerful acids, whilst the metals protuce more or less powerful liases. At ordinary temperatures, five of the whments are gaseous-viz, oxygen, hydrogen, nitrogen, chlorine, anl flumene; two are liquilviz., lromine and mercury; whilst the remaining fifty-six are solinl.

E'LDMI, a fragrant resinous substance, obtaincel from different species of the natural order Amyit. deven. It was fommerly lrought chiefly from Egypt or Ethiopia, amb was referred to a tree called $A$ mamis elemifira. Part of the li, of commerce is now bronght from America, aud is obtained from trees of other grnera, but of the same natural order, particularly lede Iedearibe, which grows in Brazil and other warm parts of America. In dry weather, incisions are made in the bark, from which the resinous jnice flows abmmbatly, and hamens in tho sum. It is collected unce a day, and prit into casks. It is at first soft and unctuous, lut beenmes hard and lrittle by ass. Eluphritem cleniferam is believed to yield the greater part of the E. of Nexico. I. is usually in larse, pale yellow, semitransparent masses, fragile, softening liy the hat of the lianc, with a smell somewhat resembling that of femuet. It is solnhle in alcohol, excent a white crystallisable residue, whieh is very light, inollorovs. and tasteless, and which is called Eteminc. The propertites of E., however, chiefly dejend on $a$ volatile wil, whieh may lre notainel from it hy listillation. E. is nsed in the prearation of stimu. lant plasters and ointments.

[^0]:    * In some of the ascidians and in salpa, the following remarkable phenomenon occurs: The heart, which is extremely simple, and of course withent valves, at delinite intervals (of alout twenty minutes) reverses the direction of its current. Bcfore the heart changes the direction of its contractions, it remains stilf for a short time, and the blood-currents in the body are thus slackened in their course before they receive an impulse in the opposite direction. The ressels entering and leaving the heart thus act alternately as an aorta and as a velaz cava.
